The Ohio Journal of Science, Vol 70, No 5, p 257-276, 1970. 97 fig, 37 ref.

Descriptors: *Lake shores, *Algae, *Lake Erie, Aquatic habitats, Lakes, Aquatic environment.
Identifiers: *Algal species, Western Lake Erie, Arnoldiella conchophila Miller.

In spite of some 70 year investigations of algae inhabiting western Lake Erie, almost nothing was known prior to this study of the shoreline as a specific habitat of these organisms. This site harbors 61 taxa, 39 of which are new records for this part of the lake, and one, Arnoldiella conchophila Miller, was previously reported only from central Russia. (Wilde-Wisconsin)

FUTURE PROSPECTS OF ALGAE AND MAN,
Vermont Univ., Burlington. Dept. of Botany.
Richard M. Klein.
Annals New York Academy of Sciences, Vol 175, p 778-781, 1970. 9 ref.

Descriptors: *Algae, *Human population, Fertilizers, Diatomaceous earth, Food chains, Oxygen, Ecology, Rhodophyta, Phaeophyta, Chlorella, Plant pathology, Industries, Ions, Cyanophyta, Radioisotopes, Temperature, Ecosystems, California, Irrigation, Economic feasibility, Water pollution control, California, Arizona.
Identifiers: Fodder, Glue, Agar, Polysiphonia, Antibiotics, Iodine, Atomic energy, Reactor cooling, Imperial Valley (Calif), Los Angeles (Calif), Tucson (Ariz).

Economic criteria of how and where algae can be used to serve man's biological, physical, and esthetic needs is considered. Although the acknowledged base of all food chains and the primary source for most of the earth's oxygen, the economic potential of algae has barely been explored. The larger red and brown algae are increasingly needed for fertilizers and fodder; antibiotics are derived from Chlorella, Polysiphonia, and other species; iodine has been obtained by burning marine algae. The potentials of utilizing the ability of algae to concentrate mineral ions hundreds of times the concentration in water, the control of speciation and its effect on pollution, possible utilization of blue-green algal parasites for increasing concentration of nitrates and phosphates sufficiently that algae may be harvested for commercial usage; use of halophytic algae in lowering excessive concentration of sodium chloride in drinking water. The qualitative and quantitative alteration in spectrum of algae species as the result of atomic energy plant operations and their effects on man are unknown, particularly whether algae will accumulate radioactive ions effectively. Algal toxonomists, algal physiologists, and algal histochemists must consider themselves ecologists and pool their knowledge to contribute to humanity's welfare. (Auen-Wisconsin)

DISTRIBUTION AND ABUNDANCE OF TUBIFICID (OLIGOCHAETA) SPECIES IN TORONTO HARBOUR, LAKE ONTARIO,
Toronto Univ. (Ontario). Dept. of Zoology.
R. O. Brinkhurst.
Journal Fisheries Research Board of Canada, Vol 27, No 11, p 1961-1969, 1970. 7 fig, 3 tab, 8 ref.

Descriptors: *Distribution, *Tubificids, *Oligochaetes, *Lake Ontario, Population, Harbors, Water pollution effects, Coliforms, Biochemical oxygen demand, Dissolved oxygen, Lake Superior, Indicators, Biomass, Nitrogen, Phosphorus, Industries, Water pollution sources, Sediments.
Identifiers: *Toronto Harbor (Canada), Lake Ontario (Canada), River mouth, Detroit River (Ontario-Mich), Don River (Ontario), Tubifex tubifex, Limnodrilus hoffmeisteri, Peloscolex multisetosus, Aulodrilus pluriseta, Potamothrix vejdovskyi, Potamothrix hammoniensis.

Dry weight values, identity, and abundance of tubificid species in Toronto Harbor were determined. The tubificid oligochaetes build up populations in excess of 200,000 per square meter. At the mouth of the Don River, an abundance of pollution-tolerant species are located, whereas small numbers and some less pollution-tolerant species are found near the island shores. No evidence of diurnal rhythms in the vertical distribution of the worms in sediment was found. That the tubificids can be used as indicators of organic pollution is confirmed by this survey, but relative abundance of worms and other benthic organisms, as well as relative profusion of the worm species themselves, rather than the mere presence of certain species, demands attention. Tubifex tubifex and Limnodrilus hoffmeisteri in great abundance and in the absence of other benthic organisms indicate gross organic pollution, as evident in Toronto Harbor and in the Don River where they constitute the entire benthos. Dry weights for tubificids are about 16% of wet weight for fresh-starved worms. Ash content averaged 34% of dry weight for worms with gut full of mud, but 11% for worms clear of gut contents. (Jones-Wisconsin)

THE FATTY ACID COMPOSITION OF TWO MARINE FILTER-FEEDERS IN RELATION TO A PHYTOPLANKTON DIET,
National Inst. of Oceanography, Wormley (England).
F. Culkin, and R. J. Morris.
Deep-Sea Research, Vol 17, No 5, p 861-865, 1970. 2 tab, 14 ref.

Descriptors: *Lipids, *Marine animals, *Diets, Phytoplankton, Diatoms, Gas chromatography, Atlantic Ocean, Zooplankton.
Identifiers: Tunicates, Fatty acids, Filter-feeders, Pyrosoma, Salpa cylindrica, Polyunsaturated acids, North Atlantic, Chemical composition.

The fatty acids of two tunicate filter-feeders, Pyrosoma (Peron) and Salpa cylindrica Cuvier, which feed directly on phytoplankton, were analyzed. Sufficiently large quantities for fatty acid analyses of phytoplankton from the same region could not be collected thus the known major features of phytoplankton fatty acid composition were used for comparison. Plant fatty acids differ from those of zooplankton. The stage in the food chain at which this modification of the phytoplankton fatty acid pattern takes place is not clear. The two species of tunicate were found to be very similar in fatty acid composition (examined by gas-liquid chromatography) and, qualitatively, to other zooplankton. However, the levels of myristic acid were considerably higher than those found in other zooplankton examined in this study, which is consistent with a phytoplankton diet. In common with phytoplankton, the tunicates were found to contain a high proportion (13x9% and 12x6% of total acids respectively) of myristic acid (14:0). Their principal polyunsaturated acid was 22.6 omega 3 and the polyunsaturated acids of the carbon-16 series, whih are usually present in phytoplankton, were not detected. (Jones-Wisconsin)

ON THE GROSS AND NET PRODUCTION OF PERIPHYTON AND PLANKTON ALGAE, (IN RUSSIAN),
Irkutskii Gosudarstvenyi Universitet (SSSR).
O. M. Kozhova.
Doklady Akademii nauk SSSR, Vol 195, No 4, p 965-968, 1970. 3 tab, 5 ref.

Descriptors: *Periphyton, *Plankton, *Productivity, Photosynthesis, Biomass, Oxygen, Algae, Comparative productivity, Eutrophication.
Identifiers: Bratsk Reservoir (Siberia), Angara River (Siberia).

This study of the Bratsk Basin included determinations of photosynthesis of periphyton by light and dark bottles, and production of phytoplankton by the Vinberg oxygen method. The reported results present averages for vegetation seasons of 1964 and 1967 for phytoplankton, and of 1965, 1967, and 1968 for periphyton. The phytoplankton consisted largely of Melosira, Stephanodiscus, Asterionella, and Cryptomonadacea sp in the spring, and of Aphanizomenon and Ceratium sp in summer. The predominant members of periphyton included Cladophora, Ulothrix, Oedogonium, Spirogyra, and Mougeotia sp. The diurnal gross and net production of periphytonic algae was 44.2 and 33.8 mg oxygen per g of fresh weight, respectively. The production to biomass ratio (P/B coefficient) of phytoplankton, recalculated on carbon, was appreciably higher than that of the periphyton. (Wilde-Wisconsin)

LOCALIZATION OF DDT IN THE BODY ORGANS OF PINK AND WHITE SHRIMP,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Center for Estuarine and Menhaden Research.
D. R. Nimmo, A. J. Wilson, Jr., and R. R. Blackman.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 4, p 333-341, 1970. 7 tab, 3 ref.

Descriptors: *DDT, *Shrimp, *Pesticides, Pesticide residues, Laboratory tests, Water pollution effects, Marine animals.
Identifiers: *Body organs, *Penaeus duorarum, *Penaeus setiferus, DDD, DDE, Hepatopancreas.

Shrimp were exposed to low concentrations of DDT in the laboratory for extended periods to compare the residues accumulated under controlled conditions with residues in natural populations. After being subjected to selected concentrations, the amount and rate of accumulation, the lethal concentration, and the amount of DDT accumulated in individual organs were determined. All shrimp exposed to 0.2 ppb DDT died within 18 days and all shrimp exposed to 0.12 ppb died within 28 days. Analysis of organs confirmed that DDT

concentrated in the hepatopancreas. Findings
w that the magnitude of contamination in some
he field samples approached that of treated
mp. Analysis of shrimp from field collections
firmed the laboratory observations that DDT
localized in the hepatopancreas; this organ is
arded when the animals are processed as food
uman consumption. The edible tail muscle had
least residue--well below that considered
rdous to human health. The survival of
eid shrimp would be threatened if relatively
amounts of DDT reached the shrimp nursery
s in estuaries and remained relatively constant.

wastes from nuclear reprocessing plants,
enium-106 is apparently the most important
isotope contaminating algae and fish. This in-
gation was conducted to understand the fac-
such as environmental conditions, and
icochemical state of ruthenium on the radioac-
contamination of organisms, and the early
tics of fixation, distribution and release of solu-
uthenium orginating from nitrate nitrosyl com-
es by some marine and freshwater organisms.
early uptake, distribution and loss by mussels,
s, fish, algae, and two gastropods of rutheni-
106 were studied for short periods under
ratory conditions. Initial uptake and distribu-
of ruthenium-106 is similar in the marine and
water lamellibranch (Mytilus and Anodonta),
ixation is much higher in the freshwater snail,
parus, than in the fish, Alburnus. In the
contamination of organisms by soluble
enium, thin structures, such as byssus, in direct
act with water, show high ruthenium content,
cating the important role of surface adsorption.
perature-dependance suggests metabolic inter-
nce, although temperature-dependance and
ral kinetics of the uptake are similar both in
and in animals studied. Slower uptake of
pes at lower temperatures indicates the advisa-
to release radioactive wastes during periods
w metabolic activity. (Jones-Wisconsin)

Tahoe (Calif), Castle Lake (Calif), Diversity,
hes.

Unexpectedly high diversity found in even small samples of lake phytoplankton has been termed 'the paradox of the plankton.' A small volume of water, for example 10 ml, usually shows some tens of species where the competitive exclusion principle might lead to expectation of only one or a few species. Patches of water may exist in which one species competes advantageously relative to the others. They are stable enough for considerable patchiness among phytoplankton, but are obliterated frequently enough to prevent exclusive occupation of each niche by a single species. With epilimnion mixing, only one or at most, a few niches for primary producers might be expected. In samples from Castle Lake, California, a high degree of patchiness for many phytoplankton species was found, indicating mixing rate is sufficiently slow in relation to the algal productivity rate, for many different niches to exist simultaneously. In Lake Tahoe, productivity per unit biomass ratios show that turnover times for carbon are often less than one day. High diversity is associated with high productivity per unit biomass and high zooplankton populations. A contemporaneous disequilibrium model is a plausible explanation of the diversity. PHOTOSYNTHESIS IN THE ALGAE,
Brandeis Univ., Waltham, Mass. Dept. of Biology.
Martin Gibbs, Erwin Latzko, Michael J. Harvey, Zvi Plaut, and Y. Shain.
Annals New York Academy of Sciences, Vol 175, p 541-554, 1970. 5 fig, 6 tab, 40 ref.

Descriptors: *Biochemistry, *Photosynthesis, *Algae, Phylogeny, Carbon cycle, Enzymes, Metabolism, Hydrogen, Euglena, Chlorella, Scenedesmus, Chlamydomonas, Cyanophyta, Chlorophyta, Oxygen, Light, Chrysophyta, Ochromonas, Respiration, Chlorophyll, Carbon radioisotopes, Carbon dioxide, Rhodophyta.
Identifiers: Warburg effect, Euglena graclis, Calvin cycle, Anacystis nidulans.

The photosynthetic carbon reduction cycle in algae is discussed from evidence described in the literature; this cycle is now firmly established. Twelve enzymically catalyzed steps are involved. At least ribulose 1,5-diP carboxylase and fructose 1,6-diphosphatase are involved in carbon dioxide fixation. The bulk of the evidence suggests that the carbon reduction cycle is the major pathway for the entry of photosynthetically assimilated carbon dioxide in the majority of chlorophyllous algae. On the basis of present knowledge of photosynthetic carbon assimilation in algae, the autotrophic phase ceases with the light-catalyzed conversion of carbon dioxide into fructose 6-P and glucose 6P. The heterotrophic phase commences with their conversion into other cellular components, sometimes referred to as secondary products. Important evidence for metabolic regulation of the photosynthetic carbon reduction cycle in algae indicates the cycle is not isolated from the rest of the cell metabolism. Assessment of the true value of these results was hindered by possible interchange of intermediates common to both photosynthesis and respiration. Successful isolation of algal chloroplasts from the giant cell of Acetabularia mediterranea, able to carry out normal photosynthesis, was recently accomplished. (Jones-Wisconsin)

HYPNODINIUM-LIKE ALGAL BLOOMS IN GEORGIA LAKES,
Georgia State Univ., Atlanta. Dept. of Biology; and Georgia Water Quality Control Board, Atlanta.
D. G. Ahearn, Edward T. Hall, Jr., and Donald J. Reinhardt.
BioScience, (Research Reports), p 115, February 1, 1971. 1 fig, 1 ref.

Descriptors: *Algae, *Lakes, *Georgia, Sewage effluents, Water pollution effects, Water pollution sources, Eutrophication, Coliforms, Spores, Life cycles, Odor, Recreation, Systematics.
Identifiers: *White algal blooms, Hypnodinium, Lake Sidney Lanier (Georgia), Lake Jackson (Georgia), Lake Cardinal (Georgia), Lake Buckhorn (Georgia).

Lakes on different river systems in northwest Georgia produced a white algal bloom of varying intensity in June, lasting 7-10 days. At its peak, dense surface flocs were found where sewage effluents were received, in all the 1970 bloom sites. Prior to, during, and after the bloom, hydrographic conditions in the Flat Creek area of Lake Lanier were monitored with observations on thermocline, temperature, pH, dissolved oxygen. Four days prior to the appearance of the bloom, the fecal coliform density increased from less than 4/100 ml to more than 240/100 ml. The milky white surface scum from all lakes was composed of bodies surrounded with a clear envelope containing large protoplasmic bodies. A dark protoplastic body matured into a dark macrospore which subdivided producing 2 to 15 or more bi-pored microspores. No exit of protoplasmic bodies through the pores was observed, although bi-flagellated zoospores occurred in large numbers in the microscope preparations. The bi-pored cells of this alga make it distinct from Hypnodinium sphaericum Klebs. It has not been directly associated with fish kills. A disagreeable odor accompanies the bloom and the thick surface flocs interfere with recreation. (Jones-Wisconsin)

BIOLOGICAL EVALUATION OF ENVIRONMENTAL QUALITY, GREEN BAY, LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
R. P. Howmiller, and A. M. Beeton.
Journal Water Pollution Control Federation, Vol 43, No 1, p 123-133, 1971. 8 fig, 2 tab, 18 ref.

Descriptors: *Evaluation, *Biological communities, *Oligochaetes, Water pollution sources, Environment, Water pollution effects, Sampling, Eutrophication, Benthic fauna, Nematodes, Amphipoda, Clams, Isopods, Snails, Midges, Caddisflies, Tubificids, Lake Michigan, Mayflies, Invertebrates, Diptera, Larvae, Wisconsin.
Identifiers: *Green Bay (Wis), Fox River (Wis), Lumbriculidae, Naididae, Leeches, Hexagenia, Sphaeriidae.

Benthos of lower and middle Green Bay (Wisconsin) were sampled in May 1969 to correspond with the same date 17 years earlier, using the same stations and nearly identical equipment in an attempt to eliminate discrepancies due to different apparatus, methodology and season of past studies. In 1952 Oligochaeta accounted for an average of 66% of the benthic organisms from Stations 2 to 10; in 1969 an average of 85%. Leeches were less abundant and less widely distributed in 1969 than in 1952. Snails occurred at ten stations in 1952 but at two in 1969. Fingernail clams were less abundant in 1969 than in 1952. While no naiad clams were reported in 1952, Lampsilis siliquoidea was found at Station 15 in 1969. The distribution of amphipods, similar in 1952 and 1969, showed more abundance and comprised a larger population percentage in 1952; Hexagenia has disappeared. The midges, pollution tolerant second only to Oligochaeta, decreased near Fox River mounth, increased north of Lon Tail Point, but decreased in relative importance. Thus benethic invertebrates, other than Oligochaeta and Chironomidae, were less abundant in 1969 than 1952 suggesting that the deterioration of the bay environment is continuing. (Jones-Wisconsin)

PRODUCTION, MINERAL NUTRIENT ABSORPTION, AND BIOCHEMICAL ASSIMILATION BY JUSTICIA AMERICANA AND ALTERNANTHERA PHILOXEROIDES,
Auburn Univ., Ala. Agricultural Experiment Station.
Claude E. Boyd.
Archiv fur Hydrobiologie, Vol 66, No 2, p 139-160, 1969. 3 fig, 14 tab, 23 ref.

Descriptors: *Aquatic plants, *Productivity, *Nutrients, *Absorption, Biochemistry, Seasonal, Inorganic compounds, Storage, Phytoplankton, Amino acids, Organic compounds, Cellulose, Proteins, Standing crop, Phosphorus, Alligatorweed, Chemical analysis, Nitrogen, Alkalinity, Cattails, Pondweeds.
Identifiers: *Biochemical assimilation, *Justicia americana, *Alternanthera philoxeroides, Mineral nutrients, Lake Ogletree (Ala), Lake Seminole (Fla), Angiosperms, Nutrient storage, Caloric content, Dry matter production.

Aquatic angiosperms probably play an important role in biogeochemical cycles of many lakes. Comprehensive studies were made to determine the amounts of nutrients bound in lake vascular flora, evaluating production, mineral absorption, and biochemical assimilation for stands of Justicia americana (L) Vahl and some comparative data obtained for alligator weed, Alternanthera philoxeroides (Mart) Griseb. Both species are emergent perennial herbs, frequently occurring in extensive, relatively monospecific, stands in shallow water areas. Net dry matter production in a Justicia americana stand was complete by mid-July. During late May and early June, maximum rate of net productivity occurred with percentage composition of most chemical constituents declining steadily as the growing season progressed. The maximum absorption rate of mobile mineral nutrients occurred prior to maximum growth. The greatest quantity of these nutrients was absorbed early and then utilized for subsequent growth. Net production of several biochemical constituents was complete by mid-June. Alternanthera philoxeroides behaved similarly. Lentic J americana stands had higher dry matter standing crops than lotic stands. There was a relation between water hardness and chemical composition of various stands. (Jones-Wisconsin)

A PLASTIC BARRIER FOR SPOT TREATMENT OF AQUATIC VEGETATION,
Texas Parks and Wildlife Dept., Waco.
R. L. White, and R. L. Bounds.
The Progressive Fish-Culturist, p 57-59, January 1971.

Descriptors: *Aquatic plants, *Herbicides, *Treatment, Diffusion, Barriers, Chemcontrol, Texas, Fishing, Recreation.
Identifiers: Myriophyllum brasiliense, Najas guadalupensis, Polyethylene sheeting, Aquathol Plus, Lake Inks (Tex), Lake Lyndon B Johnson (Tex).

Central Texas Highland lakes are most conducive to aquatic vegetation growth, impeding recreational fishing. Complete lake treatment was cost prohibitive and spot treatment by liquid and pelleted chemicals proved ineffective due to dilution. A barrier of polyethylene sheeting, to prevent dilution through wave action, was tested on sites ranging from 0.25 acre to 1.00 acre; the chemical used was Aquathol Plus. Barriers were attached to old gill nets and steel rods driven into lake bottom for stability. Where rock bottoms prevented installation of rods, styrofoam blocks raised the sheeting. Except where a barrier was destroyed by wind or inundation, the plots were cleared of vegetation for a minimum of three months; eleven sites showed no regrowth six months after treatment. Vegetation outside the plots showed little or no effect from chemical diffusion through the sheeting. Some fish became entangled, but the barriers were not damaged. A treatment rate of 1.00 ppm with a 36-hour use of the barrier was most effective. Sites were treated early in the spring and vegetation control continued into late fall when cooler temperatures inhibited regrowth. (Jones-Wisconsin)

COEFFICIENTS OF ACCUMULATION OF THE RADIOISOTOPE IRON-59 BY CERTAIN SPECIES OF FRESH WATER PLANTS,
Akademiya Nauk Litovskoi SSR, Vilnius. Inst. of Botany.
N. I. Matulyavichene.
Radiobiology, Vol 10, No 3, p 461-463, May-June 1970. 1 fig, 2 tab, 6 ref. AEC-tr-7193 from Radiobiologiya.

Descriptors: *Aquatic plants, *Radioisotope, *Absorption, Iron, Fresh water, Chara, Water pollution effects.
Identifiers: *Iron radioisotopes.

The effect of environmental factors on the uptake of iron-59 from water by aquatic plants was studied. Uptake was 12 -75% higher from natural lake water in an aquarium as compared with water which simulated the chemical composition of the lake water, but did not contain the suspended organic and inorganic material that was present in the lake water. A change in pH from 5.3 to 8.9 decreased uptake from 30 to 37 %. (Bopp-NSIC)

INITIAL UPTAKE, DISTRIBUTION AND LOSS OF SOLUBLE RUTHENIUM-106 IN MARINE AND FRESHWATER ORGANISMS IN LABORATORY CONDITIONS,
Centre d'Etude de l'Energie Nucleaire, Brussels (Belgium). Dept. of Radiobiology.
O. Van der Borght, and S. Van Puymbroeck.
Health Physics, Vol. 19, p 801-811, Dec. 1970.

Descriptors: *Radioisotopes, *Marine animals, *Absorption, Aquaria, Mollusks, Snails, Mussels, Marine algae, Aquatic animals, Fresh water, Freshwater fish, Temperature, Kinetics, Nuclear wastes, Solubility, Adsorption, Water pollution effects, Food chains.
Identifiers: *Ruthenium radioisotopes.

Ruthenium uptake extending to long-term equilibria were studied since this element is often the limiting factor in the disposal of wastes from nuclear reprocessing plants. The general kinetics including the temperature dependence were similar for four marine organisms (an alga, a mussel, and two snails); and the initial uptake was similar for marine and freshwater mussels. A relatively high concentration in thin organs in direct contact with the water suggested that surface absorption plays a role. Release of wastes during periods of low temperature (winter) will minimize biological concentration before dilution in the biosphere. (Bopp-NSIC)

Descriptors: *Bass, *Lakes, *Radioisotopes, Cesium, Potassium, Alkalinity, Conductivity, Absorption, Ion exchange, Radiochemical analysis, Water analysis, Trophic level, Water pollution effects.
Identifiers: *Cesium radioisotopes.

Bass samples were collected from five lakes during 1968 and from all six lakes during 1969. A new technique of wet ashing fish was developed which decreases the analysis time and ensures against the loss of cesium caused by thermal volatilization. A portion of the bass samples was analyzed for cesium-137 and cesium and the results show an inverse relationship with the specific conductance of the water and a direct relationship with the concentration of cesium-137 in the water. A new technique of analyses of lake water involving the use of an ion-exchange resin that is specific for cesium was developed. Objectives of the study were to determine the effect of selected water quality parameters on cesium-137 uptake on fish (alkalinity, conductivity, cesium, potassium). Premises on which the study is based have been supported. (Bopp-NSIC)

EVALUATION OF INTERNAL IRRADITION DOSES FROM INGESTION BY HUMAN POPULATION OF FOOD CONTAMINATED BY SR-90 AND CS-137 FOR SETTING LEVELS FOR DISPOSAL IN THE ENVIRONMENT, (IN FRENCH),
Commissariat a l'Energie Atomique, Fontenay-aux-Roses (France).
Arlette Garnier.
Available from the National Technical Information Service as CEA-CONF-1552, $3.00 in paper copy, $0.95 in microfiche. CEA-CONF-1552, 1970, 26 p, 14 fig, 5 tab, 8 ref.

Descriptors: *Strontium radioisotopes, *Water pollution effects, *Food chains, *Mathematical models, Absorption, Path of pollutants, Nuclear wastes, Environmental engineering, Aquatic environment, Water pollution effects.
Identifiers: *Cerium radioisotopes.

Models to determine radionuclide intake through foods are described. A model is formulated for the case of constant disposal of waste to the environment, which includes the following: concentration in aquatic food chains, uptake in food by man, and removal of radioactivity by radioactive decay and elimination. (Bopp-NSIC)

Available from the National Technical Information Service as AEC-tr-7205, $3.00 in paper copy, $0.95 in microfiche. (Radiobiology), Vol. 10, No. 4, p 584-589, July-August 1970, 3 fig, 4 tab, 18 ref) AEC-tr-7205 from Radiobiologiya.

Descriptors: *Radioisotopes, *Phytoplankton, *Metabolism, *Absorption, Marine plants, Marine algae, Phaephyta, Aquaria, Particle size, Colloids, Water pollution effects.
Identifiers: *Polonium, *Plutonium.

Radionuclide uptake by a brown alga was studied in laboratory aquaria; by phytoplankton cultured from surface sea water, in shipboard aquaria. The effect of inhibitors of the cytochrome system (cadmium chloride, sodium cyanide, and ammonium nitrate) indicated that uptake was affected by cell respiration. The radionuclides were shown to be in the form of colloids. The particle size of the plutonium salt was 0.1-0.3 microns; of the polonium salt, 0.3-15 microns. (Bopp-NSIC)

THE CRITICAL THERMAL MAXIMUM OF JUVENILE SPOT, LEIOSTOMUS XANTHURUS, LACEPEDE,
North Carolina State Univ., Raleigh. Dept. of Zoology.
David Wilder Bridges.
Available from UNC-WRRI, North Carolina State University, Raleigh, North Carolina 27607: Price - $2.50. Available from the National Technical Information Service as PB-200 263, $0.95 in microfiche. Report No 43, UNC-WRRI, N. C. State University at Raleigh, Publication No 17, Pamlico Marine Laboratory, Jan 1971. 39 p, 5 fig, 5 tab, 34 ref, append. OWRR Project B-004-NC (9).

Descriptors: *Thermal pollution, *Water pollution effects, *Water quality, *Standards, *Water temperature, *Fish physiology, Cooling water, Heated water, Fishkill, Electric power plants, Temperature, Juvenile fishes, *Juvenile growth stage.
Identifiers: Critical thermal maximum.

The Critical Thermal Maximum (CTM) of juvenile spot was determined throughout their first growing season from the time they entered the oligohaline environment until they left it. Spot were acclimated in the laboratory to combinations of temperature and salinity levels prior to the CTM tests. When the data were analyzed by multiple regression, acclimation temperature, acclimation salinity, weight, weight squared, and length were all found to be significantly important influences on the CTM of juvenile spot. Temperature was the most important influence on CTM with an R2 value of 0.92. Salinity was the least important with an R2 of 0.001, and weight, weight squared and length were all intermediate influences with R2 values of about 0.18. Response surfaces were generated from the prediction equation showing the acclimation temperature necessary to produce a fixed CTM for juvenile spot. These reveal that CTM increases with size (either length or weight) and age during the nursery period. The increase in CTM was somewhat greater between summer and fall sized spot than between spring and summer sized spot. The CTM increased as salinity increased. (Howells-North Carolina)

THE RAIN FOREST PROJECT. ANNUAL REPORT,
Puerto Rico Univ., Rio Piedras.
Carl F. Jordan, and George E. Drewry.
Available from USAEC Depository Libraries. Atomic Energy Commission Technical Report, PRNC-129, Dec 31, 1969. 144 p. Contract AT (40-1)-1833.

Descriptors: *Tritium, *Radioisotopes, *Tracking techniques, Fallout, Ecosystems, Rain forests, Strontium radioisotopes, Zinc radioisotopes, Radioecology.
Identifiers: Cesium radioisotopes, Manganese radioisotopes, Rubidium radioisotopes, Zirconium radioisotopes, Cerium radioisotopes.

The ecology and radionuclide transport were studied for a tropical rain forest with an elevation of 1500 feet in eastern Puerto Rico. Contents of calcium, copper, iron, potassium, magnesium, manganese, sodium, and phosphorus in various compartments of the ecosystem were determined from contents in leaves, bark, roots, litter, organic matter in the forest and biomass of the soil. Rates of movement of each element were related to rainfall and season. Fallout distribution was studied in terms of species, site, canopy, and presence of epiphylls on leaves. Cerium-144, cesium-137, and zirconium-95 were used as tracers. The movements of injected cesium-137, manganese-54, rubidium-86, and strontium-85 through various species of trees was followed. Tritium transport was studied in a plot to which tritiated water was applied by simulated rainfall. Runoff water was collected both beneath the litter and to a depth of five inches in the soil. A pulse of tritium was injected into a tree and the quantities determined: (1) time for tritium to reach the canopy, (2) residence half life of tritium in the free water, and (3) amount of tritium bound in the leaves by photosynthesis. The amount of tritium lost by evaporation from the soil was also determined. Ecological data is presented for plants within an area subjected to gamma irradiation in 1965. (Bopp-NSIC)

RADIONUCLIDE CYCLING IN NATURAL POPULATIONS OF AMPHIBIANS. ANNUAL PROGRESS REPORT, JUNE 16, 1969-JUNE 15, 1970,
Oregon State Univ., Corvallis.
David L. Willis.
Atomic Energy Commission Technical Report, RLO-2093-2, 1970. 3 p.

Descriptors: *Newts, *Absorption, *Radioisotopes, Cobalt radioisotopes, Zinc radioisotopes, Iodine radioisotopes, Water pollution effects, Temperature.
Identifiers: Manganese radioisotopes, Sulfur radioisotopes, Rubidium radioisotopes, Cesium radioisotopes.

Uptake and retention of radionuclides by newts was studied (manganese-54, cobalt-60, zinc-65, sulfur-85, rubidium-86, iodine-131, and cesium-134). The equilibrium value for cesium uptake from water was approached after 50 days. Component biological half lives of cesium were 9.6 and 42.8 days at 23 deg C, and 53.8 days (a single component) at 10 deg C. Cesium concentration was highest in the soft tissue. The equilibrium manganese uptake was approached in one month. After 16 days manganese was equally partitioned between skeletal muscle, skin, bone, and liver. Long-term biological half lives after acute administration were: 114 days for cobalt, 1260 days for zinc, 131 days for strontium, and 210 days for iodine. (Bopp-NSIC)

ARIEN GASTROPOD POLYCLAVE (BIOENRONMENTAL AND RADIOLOGICALAFETY FEASIBILITY STUDIES. ATLANTICACIFIC CANAL),
ttelle Memorial Inst., Columbus, Ohio.
mes A. Duke.
Available from NTIS. Betelle Technical report. BMI-171-35, Mar 1970. 75 p.

Descriptors: *Gastropods, *Canals, Pacific Ocean, Atlantic Ocean, Tropical regions, Feasibility studies, Ecology, Competition, Documentation, Estuaries, Fresh water.

An ecological study of gastropods (snails) was conducted in connection with feasibility studies for the proposed sea-level canal. An inverted index is presented to the occurrence of various taxonomic and ecologic attributes of the genera of gastropods found or expected in the littoral, estuarine, freshwater, and terrestrial ecosystems of Panama. Feeding habits and transport of gastropods through the proposed canal are discussed with relation to their ecological significance. (Bopp-NSIC)
W71-09251

DARIEN PELECYPOD POLYCLAVE (BIOENVIRONMENTAL AND RADIOLOGICALSAFETY FEASIBILITY STUDIES. ATLANTICPACIFIC CANAL),
Battelle Memorial Inst., Columbus, Ohio.
James A. Duke.
Available from NTIS. Batelle technical report BMI-171-36, Apr 1970. 43 p.

Descriptors: *Mollusks, *Canals, Pacific Ocean, Atlantic Ocean, Tropical regions, Feasibility studies, Ecology, Competition, Documentation, Information retrieval.

An ecological study of pelecypods (mollusks) was conducted in connection with feasibility studies for the proposed sea-level canal. An overlay information-retrieval system for taxonomic identification of 300 genera of pelecypods is presented. The data indicate that pelecypods are insignificant as potential hazards if introduced into the opposite side of the isthmus and that important food species in the isthmian region would not be endangered by transit of pelecypods. (Bopp-NSIC)
W71-09252

RADIOECOLOGICAL STUDIES OF TRITIUM MOVEMENT IN A TROPICAL RAIN FOREST. THE PROCEEDINGS OF THE SYMPOSIUM ON ENGINEERING WITH NUCLEAR EXPLOSIVES, LAS VEGAS, NEVADA, JAN. 14-16, 1970,
California Univ., Levermore. Lawrence Radiation Lab.
J. R. Martin, C. F. Jordan, J. J. Koranda, and J. R. Kline.
Available from NTIS. Atomic Energy Commission Conference Proceedings CONF-700101- (Vol 1).

Descriptors: *Tritium, *Absorption, *Rain forest, Puerto Rico, Tracers, Ecosystems, Plant growth, Runoff, Soil contamination, Nuclear explosions, Water pollution effects, Soil contamination effects.

Several experiments on the movement of tritium were conducted in a montane rain forest of eastern Puerto Rico. Tritiated water was used as a tracer for water movement in mature evergreen trees of the rain forest, soil and substory vegetation, and rapidly growing species. Based on all experimental data, the distribution of tritium from a simulated rainout following a one megaton thermonuclear detonation is presented. (Bopp-NSIC)
W71-09253

THE EFFECTS OF ENVIRONMENTAL STRESS ON THE COMMUNITY STRUCTURE AND PRODUCTIVITY OF SALT MARSH EPIPHTIC COMMUNITIES,
City College, New York.
J. J. Lee.
Available from NTIS. Atomic Energy Commission Technical Report NYO-3995-14, Jan 1970. 46 p.

Descriptors: *Ecosystems, *Salt marshes, *Productivity, Radioisotopes, Strontium radioisotopes, Algae, Plant growth, Temperature, Protozoa, Chlorophyta, Absorption.

The following topics are considered: Removal of calcium-45 and strontium-89, -90 from coastal environments by calcareous foraminifers (protozoa); Growth and reproduction of foramifers and epiphytic algae; Effect of temperature and light on enteromorpha (algae) and its epiphytes; Stimulation of growth of 9 out of 11 representative eipihytic algae by either arginine or alanine; and Progress in other subprojects. (Bopp-NSIC)
W71-09254

MECHANISMS OF RADIOECOLOGICAL CONCENTRATION PROCESSES IN SEAS AND OCEANS,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
G. G. Polikarpov.
Available from NTIS. Atomic Energy Commission translation AEC-tr-7030, (1969), p 49-64.

Descriptors: *Marine animals, *Marine plants, *Radioisotopes, Water pollution effects, Absorption, Food webs, Sea water, Oceans, Plankton, Phaeophyta, Programs, Radioecology.

Concentration of radionuclides in food webs is discussed. Similarities in uptake between related species are significant for extrapolation of data, and effects of parameters (salinity, concentration in sea water) are considered. Radioecology programs at the author's research institute are discussed. (Bopp-NSIC)
W71-09255

SOME OBSERVATIONS ON ALGAE INVADING A CESIUM-137 CONTAMINATED POND,
Atomic Energy of Canada Ltd., Pinawa (Manitoba).
Janet R. Dugle, and J. E. Guthrie.
Available from NTIS. Atomic Energy of Canada technical report AECL-3463, (1970). 12 p.

Descriptors: *Aquatic algae, *Radioactivity effects, *Ponds, Water pollution effects, Radioisotopes, Competition, Speciation.
Identifiers: *Cesium radioisotopes.

A comparison of the species of algae found at various collection sites within two ponds, one contaminated with cesium-137, was made in October 1968. These observations will form the basis of a study of the succession of algal species in pond communities. (Bopp-NSIC)
W71-09256

UTILITY OF RADIOISOTOPE METHODOLOGY IN ESTUARY POLLUTION CONTROL STUDIES,
Quirk, Lawler, and Matlsky Engineers, New York.
Karin A. Abood, John P. Lawler, and M. D. Disco.
Available from NTIS. Atomic Energy Commission technical report NYO-3961-1, Aug 1969. 197 p.

Descriptors: *Tracers, *Flow characteristics, *Radioisotopes, River flow, Estuaries, Dispersion, Radioactivity techniques.

A general procedure for a tracer field survey has been developed which is suitable for measurement of dispersion and flow characteristics in freshwater rivers and estuaries. Radiotracers appear to meet the technical requirements of an ideal tracer better than other materials; however nontechnical aspects have hindered adoption of radioisotope techniques. (Bopp-NSIC)
W71-09257

THE ADHESIVE PROPERTIES OF 'CHLORELLA VULGARIS',
Puerto Rico Univ., Mayaguez. Dept. of Marine Sciences.
Thomas R. Tosteson, and Luis R. Almodovar.

Available from the National Technical Information Service as AD-721 114, $3.00 in paper copy, $0.95 in microfiche. ONR technical report, no. TR-1, Apr. 1971, 35 p.

Descriptors: *Chorella, *Algae, *Fouling, *Nuisance algae, Floating plants, Seawater, Plankton, Biodegradation, Light, Temperature.
Identifiers: Acrylic resins, Glass, Thymidines, Cells (Biology), *Biodeterioration, Democolcine.

Ambient sea water contains material that promotes the adhesion of the planktonic algae Chlorella vulgaris to plastic surfaces. This adhesion takes place within 3 tp 6 hours, and is inhibited by the absence of light. The effect of light on the response of Chlorella to the ocean treated surface is due to the effect of light on the rate of growth of the algae population. The adhesion of Chlorella to glass surfaces is significantly increased in the presence of thymidine and colcemide. Thymidine accelerates the rate of growth of the algal cells and colcemide blocks this growth during mitosis. The effect of ocean deposited materials on the adhesion of Chlorella to plastic appears similar to the effect of agents that increase the relative number of cells to the G2 phase of the cell cycle on the adhesion of this cell to glass.
W71-09261

SYMPOSIUM ON ENVIRONMENTAL LEAD CONTAMINATION, HELD ON DECEMBER 13-15, 1965.
Public Health Service, Washington, D.C.

Available from the National Technical Information Service as PB-198 104, $3.00 in paper copy, $0.95 in microfiche. Public Health Service Publication no 1440, Mar 1966.

Descriptors: *Water pollution, *Water pollution effects, *Air pollution, *Public health, Toxicity, Water quality control, Industrial wastes, Diets.
Identifiers: *Lead, Toxicology, Tetraethyl lead, Antiknock additives, Food contamination, Exhaust gases, Combustion products, Air pollution effects.

The ways by which lead enters the environment are examined. The effects of lead on human health are discussed. Measures which may be needed to minimize the effects are explored. Included are reports on: Estimation of Sources of Atmospheric Lead and Measured Atmospheric Lead Levels; The Diet as a Source of Lead in Drinking water; Recent History of Lead Exposure in U.S. Industry, 1935-1965; Under What Circumstances is Inhalation of Lead Dangerous; Under What Circumstances is Ingestion of Lead Dangerous; Under What Circumstances is Direct Contact With Lead Dangerous; How Sensitive and How Appropriate are our Current Standards of 'Normal and Safe' Body Content of Lead; Possibilities of Removal of Sources of Lead Contamination in the Environment; Evaluation of Use vs. Non-use of Tetra-ethyl Lead in Gasoline; Refining to Produce Gasolines of Reduced Lead Content.

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
Federal Water Quality Administration, Duluth, Minn. National Water Quality Lab.
Alan V. Nebeker.
Journal of the Kansas Entomological Society, Vol 44, No 1, p 26-35, Jan 1971. 1 fig, 12 tab, 4 ref.

Descriptors: *Aquatic insects, *Stoneflies, *Water temperature, *Photoperiodism, Larvae, Growth stages, Inhibition, Utah, Light duration.
Identifiers: *Insect emergence, Plecoptera, Brachyptera sp., Capnia sp., Leuctra sp., Eucapnopsis sp., Nemoura sp., Perlomyia sp., Development.

The effects were analyzed of temperature as influenced by altitude on the seasonal distribution and adult emergence of 13 winter stoneflies (Plecoptera) in a single stream. Water temperature of the stream, when modified by the air temperature, solar insolation, snow cover and springs, produced significant changes in insect emergence patterns. Three main types of emergence patterns are apparent: (1) where the temperature is the main influence on the time emergence occurs, even though photoperiod may be the initial stimulus; (2) where photoperiod is the main regulation; and (3) where the photoperiodic stimulus is modified--emergence occurs at about the same time in most of the canyon but is delayed by colder temperatures at the high elevations. AN ELECTRODE CHAMBER FOR RECORDING RESPIRATORY AND OTHER MOVEMENTS OF FREE-SWIMMING ANIMALS,
Federal Water Quality Administration, Duluth, Minn; and Cincinnati Univ, Ohio, Dept. of Biological Science.
W. A. Spoor, T. W. Neiheisel, and R. A. Drummond.
Transactions of the American Fisheries Society, Vol 100, No 1, p 22-28, Jan 1971. 5 fig, 19 ref. FWPCA Grant No WP-01317-01.

Descriptors: *Bioassay, *Analytical techniques, *Fish physiology, *Water pollution effects, *Methodology, Laboratory animals, Fish behavior, Fish diseases, Environmental effects, Laboratory equipment, Laboratory tests, Monitoring.
Identifiers: *Physiological monitoring, *Experimental physiology, Laboratory recording equipment, Experimental designs.

By their effects on equilibrium potentials, water currents produced by respiratory and other movements of freely-moving animals cause changes in the potential difference between stainless steel electrodes set at opposite ends of an open system continuous-flow animal chamber. The changes are in the microvolt range, but they can be used for continuous or intermittent recording of the animal's responses in short-term or long-term studies inder widely varied environmental conditions, and the method seems suitable for monitoring. Sensitivity of the apparatus was tested. Variations in dissolved oxygen from less than 0.2 ppm to saturation, in free CO2 concentration from 0.0 to 30.. ppm, in temperature from 0 to 30C, and in pH from 3 to 11 are not limiting. (LeGore-Washington)

ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
Vyskumny Ustav Vodohospodarsky, Bratislava (Czechoslovakia).
Josef Rothschein.
German and English summaries. Vyskumny Ustav Vodncho Hospodarstva Bratislava, Informacie 26, 1970. 59 p, 12 fig, 15 tab, 35 ref.

Descriptors: *Oily water, *Gasoline, *Bioassay, *Water pollution effects, *Organoleptic properties, *Impaired water quality, Oil, Oil wastes, Water pollution sources, Lethal limit, Fish, Daphnia, Oligochaetes, Aquatic environment, Fish, Odor, Potable water, Water quality.
Identifiers: *Oil pollution, *Refinery wastes, Oil spills, Oil products.

Fish, oligochaetes (Tubifex), and Daphnia were used to determine the toxicity of desalted crude oil, 'gas oil,' petroleum, gasoline, and waste water from fuel processing. Daphnia were the most sensitive to the above products, fish next, and oligochaetes were most tolerant. Toxicity depended to a large degree on the ability of the product to emulsify in water. The odor threshold of the substances in water ranged from 1/2 to 1/10 of their lethal values, and it is very difficult to produce potable water from a stream receiving refinery wastes. (Katz and LeGore-Washington)
W71-09374

EFFECTS OF HYPOXIA UPON RESPIRATION AND CIRCULATION IN THE DOGFISH SCYLIORHINUS STELLARIS,
Max-Planck-Institut fuer Experimentelle Medizin, Goettingen (Germany). Dept. of Physiology.
J. Piiper, Doris Baumgarten, and M. Meyer.

mparative Biochemistry and Physiology, Vol 36, 513-520, 1970. 2 tab, 19 ref.

escriptors: *Fish physiology, *Dissolved oxygen, Elasmobranches, *Sharks, *Respiration, *Circution (Animals), Environmental effects, Oxygen g, Fish behavior, Oxygen demand, Oxygen quirements.
entifiers: *Hypoxia, Dogfish, Heart rate, Cardiac tput, Blood pressure, Oxygen consumption.

hanges in respiration and circulation induced by poxia were studied in the dogfish, Scyliorhinus ellaris, by reducing the oxygen pressure in ament water from 142 mm Hg to 54 mm Hg. The folwing changes were observed: (a) O2 uptake ecreases markedly, (b) respiratory rate did not ange significantly, but the ventilation rate inreased, showing a maximum at moderate hypoxia,) heart rate decreased, and cardiac output meared according to the Fick principle also showed a ght tendency to decrease, and (d) mean blood essure in the ventral aorta and in peripheral artees decreased. The effects of hypoxia are mostly in reement with those found in other asmobranchs, but differ in many respects from anges observed in teleosts. (LeGore-Washingn)

EPORT ON A FISH KILL AT LAGUNA JOYUA, WESTERN PUERTO RICO, IN THE UMMER, 1967,
uburn Univ., Auburn, Alabama, and Florida State niv., Tallahassee, Dept. of Oceanography.
ancisco A. Pagan, and Herbert M. Austin.
aribbean Journal of Science, Vol 10, Nos 3-4, p 3-208, Sept-Dec 1970. 2 fig, 1 tab, 1 ref.

escriptors: *Fishkill, *Mortality, *Dissolved oxen, *Oxygen sag, *Salinity, *Environmental efcts, *Water temperature, Crabs, Shrimp, oughts, Water quality, Physiological ecology, Cliatology, Puerto Rico.
entifiers: *Natural mortality, Laguna Joyunda uerto Rico).

mass mortality which occurred in Laguna Joyun, Puerto Rico, on June 7, 1967, was investigated. veral species of fish, the blue crab (Callinectes .) and one species of peneid shrimp were killed. gh air temperatures and severe drought were ncluded to have interacted with high levels of ght plant respiration, resulting in rapid water aporation, high salinity (to 43-44 ppt), low disved oxygen values (less than 0.5 ppm) and high ater temperature (35 C). The mortality was emed to have been caused by natural enomena. The situation is compared with a nilar mortality that occurred in Laguna Joyuda in 63. (LeGore-Washington)

FFECT OF SESAMEX ON BRAIN CETYLCHOLINESTERASE INHIBITION BY ARATHION IN FISHES,
ississippi State Univ, State College, Dept. of ology.
mes R. Gibson, and J. Larry Ludke.
lletin of Environmental Contamination and Toxology, Vol 6, No 2, p 97-99, 1971. 1 tab, 8 ref.

escriptors: *Organophosphorous pesticides, Toxicity, *Biochemistry, *Pesticide toxicity, Fish physiology, Inhibition, Bioassay, Inhibitors, nzymes, Sunfishes, Lepomis species, Shiners, uegills, Pathology, Water pollution effects, ater pollution treatment, Pesticides.
Identifiers: *Sesamex, *Parathion, Toxic mechanisms, Mechanisms of toxicity, Brain, Acetylcholinesterase, Golden shiner, Notemigonus sp., Nervous tissue.

The toxic action of parathion is generally considered to result from inhibition of acetylcholinesterase (AChE). Sesamex is a suspected antagonist to this toxic mechanism. This was tested using brain AChE from golden shiners (Notemigonus chrysoleucas), green sunfish (Lepomis cyanellus) and bluegill sunfish (Lepomis macrochirus). Experiments indicated that the degree of brain AChE inhibition resulting from exposure to parathion is decreased by pretreatment of fish with sesamex. The decrease is presumably mediated through inhibition of the enzyme that converts parathion to the potent anticholinesterase, paraoxon. (LeGore-Washington)

SENSITIVITY TO PESTICIDES IN THREE GENERATIONS OF SHEEPSHEAD MINNOWS,
Bureau of Commercial Fisheries Center for Estuarine and Menhaden Research, Gulf Breeze, Florida, Pesticide Field Station.
Hugh T. Holland, and David L. Coppage.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 4, p 362-367, 1970. 1 fig, 1 tab, 3 ref. Gulf Breeze Contribution No. 76.

Descriptors: *DDT, *Endrin, *Chlorinated hydrocarbon pesticides, *Toxicity, *Fish genetics, *Water pollution effects, Bioassay, Lethal limit, Minnows, Fish physiology, Fish reproduction, Pesticide toxicity, Fish management, Resistance, Fish populations, Balance of nature, Environmental effects, Fecundity, Persistence.
Identifiers: *Natural selection, Fish breeding, Sheepshead minnows, Cyprinodon sp.

An attempt was made to determine whether succeeding generations of sheepshead minnows (Cyprinodon variegatus) exposed to DDT can develop resistance to DDT, and whether 'cross-resistance' to endrin, a related insecticide, can develop. Static bioassays were utilized. Sensitivity to DDT varied with time of year in both control and experimental generations. Sensitivity did not decrease consistently in any experimental generation, but all decreases observed occurred during the interval March-June. (LeGore-Washington)
W71-09379

INTERACTION OF PESTICIDES WITH AQUATIC MICROORGANISMS AND PLANKTON,
Arizona Univ, Tucson, Dept. of Entolmology.
George W. Ware, and Clifford C. Roan.
Summaries in English, French and German. Residue Reviews, Vol 33, p 15-45, 1971. 16 tab, 84 ref.

Descriptors: *Reviews, *Bibliographies, *Data collections, *Pesticides, *Organo-phosphorous pesticides, *Chlorinated hydrocarbon pesticides, *Herbicides, *Pesticide toxicity, *Water pollution effects, *Plankton, *Aquatic microorganisms, Organic pesticides, Insecticides, Toxicity, Lethal limit, Pesticide kinetics, Pesticide residues, Zooplankton, Phytoplankton.

A review is presented of the literature relative to the effects of several pesticides on both zoo- and phytoplankton. Considered are: the introduction of pesticides into the aquatic environment, pesticide toxicity, freshwater and marine microorganisms, organochlorine and organophosphate insecticides, and herbicides. The contrasts in interpretation of toxicity data are discussed and a few possible explanations for this variation are suggested. A table indicating the chemical designations of 81 pesticides is provided. (LeGore-Washington)
W71-09381

THE EFFECTS OF WATER HARDNESS ON THE UPPER LETHAL TEMPERATURE OF THE GREEN SUNFISH (LEPOMIS CYANELLUS),
New Mexico State Univ., University Park.
Thomas Oliver Boswell.
MS Thesis, July, 1967. 31 p, 4 fig, 4 tab, 28 ref. OWRR Project A-003-N MEX (2).

Descriptors: *Hardness (Water), *Lethal limit, *Water temperature, *Sunfishes, *Lepomis species, Water properties, Water quality, Temperature, Heated water, Thermal pollution, Heat resistance, Bioassay, Acclimatization, Environment, Physiological ecology.
Identifiers: Green sunfish, LD-50, Nerve function.

The effects of water hardness on the upper lethal temperature of the green sunfish were examined. Fish were acclimated and tested at hardness levels of 30, 180 and 400 ppm, and the 48 hr median upper lethal temperatures and critical thermal maxima were determined for acclimation temperatures of 20C and 30C. The significant effects of water hardness on lethal temperatures were observed. Winter-collected fish exhibited lower levels of thermal resistance than did summer-collected fish. Behavioral evidence supports the hypothesis that heat death in green sunfish results from failure of the nervous system. (Katz and LeGore-Washington)

THE EFFECT OF PP'-DDT ON TADPOLES OF THE COMMON FROG (RANA TEMPORARIA),
Nature Conservancy, Abbots Ripton (England). Monks Wood Experiment Station.
A. S. Cooke.
Environmental Pollution, Vol 1, p 57-71, 1970. 7 fig, 3 tab, 25 ref.

Descriptors: *DDT, *Water pollution effects, *Frogs, *Resistance, Chlorinated hydrocarbon pesticides, Bioassay, Morbidity, Mortality, Growth, Pathology, Self-purification.
Identifiers: *Rana temporaria, *Tadpoles, DDE.

Tadpoles of the common frog (Rana temporaria L.) were kept for 1 hr in amphibian saline containing 0.01, 0.1, 1.0 or 10.0 ppm pp'-DDT. After treatment in the 0.1, 1.0 or 10.0 ppm DDT media, all tadpoles enter an uncoordinated, hyperactive phase, which can begin after less than 1 hr. This is followed by either a moribund phase and death or by a return to normal activity. Body weight decreases during the hyperactive period, and the development of certain tadpoles is suppressed. Larger tadpoles also become hyperactive during treatment. After treatment, many of these larger tadpoles develop a hole in the snout between the upper mandible and the nostrils, a condition that also retards feeding and development. This abnormal snout reverts to normal after metamorphosis. Smaller tadpoles are more vulnerable to DDT poisoning of the environment. The absolute amount of DDT taken in seems independent of size, so that tissue content is greater for small tadpoles. Rate of loss of pesticide is higher for large tadpoles. In the field, DDT may reduce a frog population by increasing mortality during the larval stage or, more probably, immediately after metamorphosis, or by modifying behavior. Precise evaluation is difficult because of high natural mortality among wild populations. (Katz-Washington)

LAKE ERIE: COMMON EFFORT CAN SAVE IT.
Bureau of Commercial Fisheries, Washington, D.C.

Commercial Fisheries Review, Vol 32, No 8-9, p 19-20, Aug-Sept, 1970. 4 fig.

Descriptors: *Lake Erie, *Lake fisheries, *Fisheries, *Fish management, *Fish populations, *Aquatic environment, *Fish harvest, *Dissolved solids, *Water temperature, *DDT, *Heavy metals, Great Lakes, Market value, White bass, Yellow perch, Lake trout, Fish conservation, Fish food organisms, Fishkill, Pounds fish per acre, Fish populations, Benthic fauna, Dissolved oxygen, Water pollution effects, Rehabilitation, Perches.
Identifiers: *Mercury, Catch statistics, Solids, Climatic changes, Lake rehabilitation.

A general review is given of the fisheries status of the Great Lakes in regard to the effect of environmental changes. There has been a shift in the catch from high value fish to low value fish, such as yellow perch and white bass. Total dissolved solids have increased 50 ppm during the past 50 years. Water temperatures have increased 20F since 1920 due to climate changes. Degradation of the oxygen regime has altered the populations of bottom organisms, which were valuable as fish food. The poundage of fish taken has maintained itself, but the species shift has reduced the value of the catch. DDT values are below 5 ppm, but mercury contamination is serious. The environmental problems of Lake Erie are regarded as complex and discouraging. (Katz-Washington)
W71-09387

CHRONIC ENDRIN POISONING IN GOLDFISH, CARASSIUS AURATUS,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Blake F. Grant, and Paul M. Mehrle.
Journal of the Fisheries Research Board of Canada, Vol 27, No 12, p 2225-2232, 1970. 3 tab, 18 ref.

Descriptors: *Endrin, *Lethal limit, *Pesticide toxicity, *Water pollution effects, *Fish physiology, *Growth rates, *Inhibitors, Food chains, Pesticide residues, Toxicity, Growth, Gonads, Lipids, Mortality, Inhibition, Pesticides, Pathology, Sodium, Osmosis, Fishkill, Public health.
Identifiers: *Goldfish, *Carassius sp., *Chronic pollution, Gonadal development, Thyroid activity, Blood serum, Histopathology, Osmoregulation.

Endrin incorporated into the diet of mature male goldfish for 3-4 months affected growth, gonad development, thyroid activity, serum characteristics, total and differential body fat, behavior and survival. A biphasic response to endrin dosage was characteristic. Low doses (4.3-43.0 ug/kg body weight/day) either caused no detectable effect or were stimulatory, as indicated by increased growth rates and higher total body fat contents. The two highest doses (143 and 430 ug) caused mortality, lowered growth rates, and caused other chronic symptoms. They also caused decreased thyroid cell heights, inhibited game to-genesis, lowered total body fat, and resulted in less vacuolization in liver cells. All doses except the highest caused elevated serum Na concentrations. The fish receiving the highest dose suffered osmoregulatory failure. Induced spermiation was not affected; fish receiving 143 or 430 ug/kg had greatly reduced, but functional testes. (LeGore-Washington)
W71-09388

THE EFFECT OF SIZE ON THE UPTAKE OF DDT FROM WATER BY FISH,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
Philip G. Murphy.
Bulletin of Environmental Contamination and Toxicology, Vol 6, No 1, p 20-23, 1971. 2 fig, 6 ref.

Descriptors: *DDT, *Pesticide residues, *Absorption, *Water pollution effects, *Path of pollutants, *Chlorinated hydrocarbon pesticides, Dieldrin, Chromatography, Food chains, Analytical techniques, Bioassay, Fish food organisms, Pesticide kinetics, Pesticide toxicity, Fish physiology.
Identifiers: *Gas-liquid chromatography, *Gambusia affinis, Mosquito fish, DDT-Carbon-14.

Attempts are made to evaluate the intra-specific relationship between body size and DDT uptake in the mosquito-fish, Gambusia affinis. Carbon-14 labelled p,p'-DDT was used in static bioassays. Gas-liquid chromatography determinations of naturally occurring DDT levels in experimental fish were made. The smallest fish were most efficient at removing DDT from water, with the efficiency diminishing rapidly as the fish increased in weight past 200 mg. Direct absorption of DDT from the water may be more important than magnification via the food chain. (LeGore-Washington)
W71-09389

EFFECTS OF SALINITY ON UPTAKE OF DDT, DDE AND DDD BY FISH.
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
Philip G. Murphy.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 5, p 404-407. 1 tab, 9 ref.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Absorption, *Path of pollutants, *Water pollution effects, *Fish physiology, *Salinity, Bioassay, Chromatography, Pesticide residues, Pesticide kinetics, Aquatic environment.
Identifiers: *DDE, *DDD, *Gambusia affinis, Mosquito fish, Gas-liquid chromatography.

The effects were assessed of salinity on the uptake of DDT residues by the mosquito fish (Gambusia affinis) from pesticide concentrations similar to those of environmental waters. Background levels of DDT, DDE and DDD in experimental fish were determined by gas-liquid chromatography. Ethanol solutions of DDT, DDE and DDD were innoculated into static bioassays, in which salinities of 0.15, 10.0 and 15.0 ppt were tested. Accumulation of these compounds was less at 15.0 ppt, and increased salinity apparently had a greater effect on DDT uptake than on uptake of DDE or of DDD. Possible mechanisms of effect are discussed. (LeGore-Washington)

SOIL USE AND WATER QUALITY - A LOOK INTO THE FUTURE,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
Frank G. Viets.
Journal of Agricultural Food Chemistry, Vol. 18, No. 5, p. 789-792, May 1970, 1 table, 21 references.

Descriptors: *Water pollution sources, *Fertilizers, *Nutrient requirements, Economic justification, Cost-benefit analysis.
Identifiers: Agricultural Nitrogen Institute, South Platte Valley, Colorado.

Increasing use of commercial fertilizers is being blamed for substantial eutrophication of surface water and nitrate accumulation in ground water. The author maintains that the available evidence on this subject is circumstantial rather than direct. He explains that bans on or regulations of fertilizer use are not justified on the basis of existing information, but regulation on a local option basis along with other nutrient control measures may be needed when the facts become sufficient. PHOSPHATES IN DETERGENTS AND THE EUTROPHICATION OF AMERICA'S WATERS.

Available from Sup of Doc, US Government Printing Office, Wash DC 20402 Price $0.40. House Report No 91-1004, twenty-third report by The Comm on Gov't Operations, 91st Cong, 2d Sess (1970). 88 p, 2 fig, 9 tab, 87 ref, 2 app.

Descriptors: *Eutrophication, *Phosphates, *Detergents, *Pollution abatement, Water pollution effects, Nutrients, Phosphorous, Water softening, Legal aspects, Hard water, Public health, Cost comparisons, Aquatic algae, Grants, Model studies.

Phosphorous pollution causes eutrophication, and over half of the phosphorus pollution in the United States is caused by detergents. In these hearings the detergent industry contended that phosphate detergents did not harm and were essential to maintain cleanliness and sanitation standards, since there was no suitable replacement. Rebuttals to these defenses suggest several alternatives to phosphate detergents. The removal of nutrients from waste waters instead of phosphates from detergents as suggested by the industry, would be costly, slow and create additional pollution problems. The committee concluded that no progress had been made in combating eutrophication from detergents and recommended a series of gradual reductions in the use of phosphate detergents, with a complete elimination of their use by the end of 1972. Additionally, the committee recommended: the mandatory labeling of phosphate content during the interim period, expanded research by the Federal Water Quality Administration to develop low-phosphorus or phosphorus-free detergents, and the immediate elimination of the Industry-Government Task Force, whose actual purpose was to secure government cooperation in retaining phosphate detergents. (See also W71-09430) (Gallagher-Florida)

PHOSPHATES IN DETERGENTS AND THE EUTROPHICATION OF AMERICA'S WATERS.
Available from Sup of Doc, US Government Printing Office, Wash DC 20402 Price $1.25. Hearings--Subcomm on Conservation and Natural Resources--House Comm on Gov't Operations, Dec 15 and 16, 1969, 91st Cong, 1st Sess, 1970. 318 p, 2 fig, 47 tab, 2 chart, 110 ref, 3 app.

Descriptors: *Eutrophication, *Phosphates, *Detergents, *Water pollution sources, Phosphorus, Sewage treatment, Municipal wastes, Environmental sanitation, Technical feasibility, Economic feasibility, Administrative agencies, Federal government, Legal aspects, Waste water treatment, Industries, Abatement, Water quality control.

Numerous statements and documents on diverse aspects of phosphate detergents and the effect of phosphates in the eutrophication of America's waters were presented. Representatives of the Soap and Detergent Association presented the detergent industry's position. Testimony was also received from: (1) the Institute of Water and Air Pollution in Stockholm, Sweden; (2) Water Pollution Research and Applications, Inc.; (3) the Commissioner of the Federal Water Pollution Control Administration; (4) Eldib Engineering and Research, Inc.; (5) the Great Lakes Institute; (6) the Assistant Secretary of the Interior for Water Quality and Research; (7) the Center for Urban Studies of the University of Chicago; (8) the Eutrophication Information and Water Resources Centers of the University of Wisconsin; and (9) the Joint Industry-Government Task Force. The testimony dealt with such topics as: (1) the present feasibility of eliminating the use of phosphate detergents, (2) the sources of phosphorous input, (3) information concerning all federal grants or contracts for phosphate removal, (4) problems of removing phosphates from municipal sewage, (5) alternatives to phosphate detergents, and (6) measures taken by the Joint Industry-Government Task Force. cking wastes.

n aerobic biological contactor, in the form of a
tating disc pilot plant, was used to stablize the ef-
ent from an anaerobic lagoon used for treating
at packing wastes. A hydraulic loading of 8.0
d/ft2 of disc area was applied to the three stages
the rotating disc contactor. Under these condi-
ns, no detectable DO was present in the effluent
om any of the stages. BOD reduction in the first
ge was 42.5% and only 50.2% for all three stages
sed on settled BOD values. For the second test
n, the rotational speed of the discs was increased
om 3-6 rpm. DO was still detected only occa-
nally, while first stage BOD reduction averaged
.5% and 65.4% was the average for the overall
stem. For the final test, the flow rate was cut in
lf. There was a DO concentration range of 0.9-
5 mg/l in the effluent from the first stage which
rsisted through the unit. BOD reduction for the
st stage was 79.5% and overall BOD reduction
s 88.2%. From these results, a one stage rotating
c contactor loaded at a rate of 4 gpm/ft2 of con-
ctor area was determined to provide optimum
atment. This system facilitates odor control, and
o provides inexpensive efficient treatment.

atment, Design criteria, Sampling, Analytical
hniques, Evaporation, Biological oxygen de-
mand, Urine, Coliforms, Pathogenic bacteria, Animal parasites, Disinfection, Chlorination, Louisiana, *Treatment facilities.
Identifiers: *Primates, *Bacteriological analyses, Feces.

Water and waste water balances were performed on the Delta Regional Primate Research Center in Covington, Louisiana. Total input of both food and water was measured for selected animals and urine, feces, and vomitus of the animals were also collected and analyzed. Average food consumption was 3.0% of body weight, and an estimated 50% of the food is wastes. Measurement of the BOD of the collected waste materials established primate wastes as being 3 to 6 times higher in BOD than conventional municipal wastes. No correlation of total solids with genera, age, weight, or sec of the animals was discovered. Primate feces were found to be cruder than human feces, also and considerable difficulty in finding a suitable feed for the dilution water. Further study of this phenomenon has been planned. Monitoring of daily water usage revealed a fairly constant flow. There was little daily fluctuation in cage washwater, since the animal population was fairly constant, and all cages had to be washed. Bacteriological analysis revealed a wide variety of organisms including several non-specific parasites and numerous pathogens. This discovery neccessitated that particular attention be given to chlorination and disinfection. (Lowry-Texas)

WATER RECLAMATION AND ALGAE HARVESTING,
Asian Inst. of Tech., Bangkok (Thailand).
M. G. McGarry, and C. Tongkasame.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 824-835. 9 fig, 3 tab, 9 ref.

Descriptors: *Ponds, *Water reuse, Reclamation, Algae, Protein, *Oxidation lagoons, Climatic zones, Precipitation, Coagulation, Lime, Hydrogen ion concentration, Temperature, Chlorination, Floatation, Dewatering, Drying, Cost analyses, Waste water treatment.
Identifiers: *Algae harvesting.

Application of high rate oxidation ponds equipped with algae harvesting may help to augment the dwindling water supplies of large metropolitan areas by reclaiming waste water for varied uses, while at the same time producing a usable algal feed supplement. Conditions for optimal operation include: (1) 200 lb BOD/acre/day; (2) 17.7 in. depth; and (3) 1 day detention time. Ponds operated in this manner provide an average effluent BOD (after algae removal) of less than 10 mg/l, and one acre of pond can produce 100,000 lb per yer of algae containing 60% protein. Chemical coagulation and precipitation chemicals studied included lime, alum, and 50 different polyelectrolytes. Polycations were found to be most economic, but usage of polyelectrolytes as aids contributed a greater chemical cost than usage of alum along at pH 6.5. The downflow solids contact system was examined for removal of the algae, either by the split flow, dissolved air, or supersaturated oxygen principles. The algal paste was sun dried on undrained flat plates, to less than 10% moisture. At solar energy levels of 480 g cal/sq cm/day, 2800 lbs/day of dried algae could be processed on one acre. The results of the investigations were incorporated into an urban model which includes recycling of clarified pond effluent for household cleaning purposes. A 67% reduction in raw water needs was predicted for such a system, but much further investigation and refinement is necessary. (Lowry-Texas)

Descriptors: *Activated carbon, Freeze drying, Vacuum drying, Evaporation, Temperature, Mixing, Separation techniques, Analytical techniques, Chromatography, Spectrophotometry, Filtration, Instrumentation, *Organic compounds, Waste water treatment.
Identifiers: *Desorption, *Standard CCE method, Choroform, Thermocouple.

Before desorption of organic materials from carbon can be accomplished, the carbon must be dried as completely as possible. Laboratory analyses have established that the amount of residual moisture remaining in dried carbon is a function of the method used for drying. In particular, freeze drying leaves less residual moisture than rotary evaporation, which leaves much less residual moisture than air drying. The Standard drying procedures adopted by the American Public Health Association led to wide variations in results, and some modifications are necessary before reproducible results can be obtained from separate investigators. The carbon chloroform extraction method was also subjected to laboratory scrutiny. The specified operating procedure is subject to wide variation in interpretation, to such an extent that reproducibility of results of different investigators is almost nonexistent. The Soxhlet extraction efficiency is affected by the moisture content, and the variability of the moisture content has already been established. Thermal degradation of certain organics may also occur as a result of high pot wall temperatures produced by the heating mantle. Therefore, although the ideas behind the tentative Standard CCE Method are sound, the non-specific nature of the operating conditions may introduce considerable error when considered on an abolute basis. THE EFFECT OF CELL RE-CYCLE ON ACTIVATED SLUDGE PROCESS OPERATION,
California Univ., Davis. Dept. of Civil Engineering.
E. D. Schroeder.
Water Research, Vol 5, No 1, January 1971, p 29-39. 9 fig, 7 ref.

Descriptors: *Activated sludge, *Kinetics, Biodegradation, Mixing, Aeration, Organic loading, Analytical techniques, Mathematical models, *Wastewater treatment, Biological treatment, Cytological studies.
Identifiers: Re-cycle cell concentration, Plug flow, Residence time.

Conventionally designed activated sludge processes are currently operating in a range bounded by ideal plug flow and ideal stirred tanks, with completely mixed systems approaching the ideal stirred tanks in operational characteristics. In all cases, trade-offs occur between growth rate (and corresponding bio-oxidation rate), recycle ration, and recycle cell concentration. Recycle cell concentration increases result in increases in reactor cell concentration, for a given recycle ratio, and also a decrease in the residence time necessary to remove a given amount of organic material. The necessity for high recycle cell concentrations establishes the importance of the secondary clarifier to the system. On a general basis, usage of low secondary clarifier overflow rates would probably mean fewer operational difficulties with the activated sludge process. The most important factor directly concerned with recycle, however, is that recycle and cell concentration ratios directly influence the observed growth rate which alters the actual kinetic processes. The effect of recycle must therefore, be included in field data in order for such data to be reliable. (Lowry-Texas)

OCCURRENCE OF FILAMENTOUS MICROORGANISMS IN ACTIVATED SLUDGE,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
G. J. Farquhar, and W. C. Boyle.

Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 779-787. 28 fig, 1 tab, 19 ref.

Descriptors: *Activated sludge, *Microorganisms, Organic loading, Dissolved oxygen, Biochemical oxygen demand, Hydrogen ion concentration, Municipal wastes, Sphaerotilus, Isolation, Aeration, Chlorination, Waste water treatment, Wisconsin.
Identifiers: *Sludge bulking, *Filamentous microorganisms, Lactic acid bacteria, Bacterial physiology.

Samples of activated sludge taken from waste water treatment plants in Southern Wisconsin were analyzed by microbiological techniques, and 17 different types of filamentous micro-organisms were found to be present. The source, date of collection, extent of growth, sludge volume index (SVI), and the mixed liquor suspended solids (MLSS) concentration were recorded for each organisms studied. Thiothrix, Sphaerotilus, lactic acid bacteria, Toxothrix, and Vitreoscilla, having been previously documented as suspected causative agents of sludge bulking, were closely scrutinized. Past difficuluties in determining which organisms were actually present in a sample, due to lack of both facilities and trained personnel, have led to many inconsistencies in previous data. Although exact identification was not possible for individual organisms in most cases, filamentous microorganisms in general have been recognized as contributors to the bulking problem. In most instances, filamentous organisms become entangled with the flock particles creating a bridging effect, so that the floc moves as a mass, and this factor was recognized as leading to poor dewatering characteristics. At present, raw waste water and return sludge chlorination, return sludge reaeration, sludge loading rate reductions, mixed liquor DO adjustments, and preaeration of raw waste water have all been employed to stop sludge bulking. However, since each filamentous organisms responds differently to the control measures, identification is essential to selection of the correct remedial action, eliminating trial and error measures which may make conditions even worst. ANAEROBIC STABILIZATION OF POTATO PROCESSING WASTES AS AFFECTED BY ORGANIC LOADING RATE,
Idaho Univ., Moscow. Dept. of Chemical Engineering.
A. T. Wallace, D. W. Siddoway, and M. L. Jackson.
Idaho University Engineering Experiment Station, Research Report No 9, Jan 1970. 28 p, 3 fig, 7 tab, 6 ref.

Descriptors: *Industrial wastes, *Anaerobic digestion, *Organic loading, Hydrogen ion concentration, Chemical oxygen demand, Temperature, Alkalinity, Methane, Carbon dioxide, Nutrients, Sampling, Monitoring, Automatic control, *Waste water treatment, Idaho.
Identifiers: *Potato processing wastes, Volatile acids, Rate constants, Detention times.

Laboratory scale reactors were constructed to determine the treatability of potato processing wastes by anaerobic stabilization. The temperature was fixed at 35 deg C, the residence time of 5 days, and the feed COD levels were 2,000, 4,000, 10,000, and 20,000 mg/l. Efficiency of treatment was determined on the basis of: (1) the reduction in the level of COD between the feed and effluent streams; (2) the methane: carbon dioxide ratio in the effluent gas; and (3) the rate of gas production. From these investigations it was determined that: (1) volumetric efficiency of COD reductions increased linearly with increased volumetric loadings; (2) % COD reduction was nearly constant for a wide range of organic loadings; (3) an anaerobic reactor operated at a 5 day detention time and 35 deg C will stabilize 60% of the COD at loading up to and possibly greater than 20,000 mg/l; (4) increased loadings decrease reactor stability making continuous pH monitoring and control essential for a full-scale reactor; and (5) the biochemical reactions involved had an average pseudo-first order rate constant of .244 days-1, with a range between .150 days-1 and .354 days-1. Further study over a wider range of temperatures, detention times, and organic loadings is necessary to establish characteristics of failures. (Lowry-Texas)

SOME PROBLEMS OF INDUSTRIAL WASTE DISPOSAL FROM A FERTILIZER PLANT,
Electric Reduction Co. of Canada Ltd., Toronto (Ontario).
J. H. Forster.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, Niagara Falls, Ontario, p 6-17. 2 fig, 3 tab, 6 ref.

Descriptors: *Phosphates, *Sedimentary rocks, *Fertilizers, *Industrial wastes, Gypsum, Fluorides, Sedimentation, Lagoons, Neutralization, Lime, Slurries, Hydrogen ion concentration, Maintenance, Flow rates, Water reuse, Cost analysis, Evaporation, *Waste water treatment, Waste disposal.

The two major pollutants in effluents from phosphate-containing fertilizer plants are fluorides and gypsum. The fluorides are present as 3 to 4% by weight of the phosphate rocks which are used to produce phosphates. The gypsum is produced in acid splitting of the phosphate from the phosphate rock and is collected as filter cake. Gypsum is formed at a rate of 1.5 to 1.6 tons per ton of rock digested, or 4.6 to 5.2 tons per ton of P sub 2 O sub 5 produced. Total effluent flow averages 3500 IGPM, and contains 27TPD P sub 2 O sub 5, 68. 7TPD fluorides, and 2400 TPD gypsum. This effluent is treated with lime to neutralize the P sub 2 O sub 5 and flurorides, settled to remove the precipitated phosphates and fluorides along with the by-product gypsum, and discharged into the Grand River after clarification. Recurring problems with operation and maintenance led to the construction of a $270,000 addition to recycle the plant water. Significant operation and maintenance savings are being realized, and effluent flow has been reduced from 3000 to 4000 IGPM to approximately 200 IGPM. (Lowry-Texas)

UTILIZATION AND STABILIZATION OF SOLID WASTES,
Bureau of Mines, Salt Lake City, Utah. Salt Lake City, Metallurgy Research Center.
K. C. Dean, R. Havens, and E. G. Valdez.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, Niagara Falls, Ontario, p 18-42.

Descriptors: *Solid wastes, *Industrial wastes, Waste dumps, Cost analysis, Economic feasibility, Technical feasibility, Vegetation establishment, Stope stability, Bank stability, Erosion, Fertilization, Nitrogen, Phosphates, Leaching, Metals, Toxicity, Hydrogen ion concentration, Solubility, Slimes, Dewatering, Salinity, Germination, Radiation, Percolation, Osmotic pressure, Utah, Waste disposal, Waste water treatment.
Identifiers: *Salt Lake City, Waste recovery.

Expansion of the population is rapidly eliminating isolated areas. These areas, many of which had formerly been used as dumping grounds for waste products because of their isolation, must now be redecorated and their original natural beauty restored. Utilization and reclamation studies have been initiated to discover: (1) methods of producing copper from dump leach solutions using shredded auto soap as a cementation medium; (2) ways of recovering zinc from foundry dusts; (3) methods of recovering additional values from copper and uranium mill wastes; and (4) procedures for the production of ceramic and construction materials from waste products. Stabilization studies using physical, chemical, vegetative, and combination techniques have also been made in attempts to convert ugly slag piles to more attractive vegetation areas. Tables on costs are presented for the various methods. In the case o stabilization, costs for a combination stabilizatio were reported at $136 per acre. Further extensiv economic and technological feasibility studies ar continuing. (Lowry-Texas)

TREATMENT OF BRASS MILL EFFLUENT AT ANACONDA TORONTO PLANT,
Anaconda American Brass Ltd., Toronto (Ontario).
J. J. McGrath.
Proceedings, Ontario Industrial Waste Conference 16th, June 1969, Niagara Falls, Ontario, p 82-89.

Descriptors: *Industrial wastes, *Acids, Neutraliza tion, Hydrogen ion concentration, Lime, Floccula tion, Coagulation, Water re-use, Oxidation-reduc tion potential, Copper, Iron, Chemical precipita tion, Cost analysis, Pumps, Sludge, Baffles Storage, *Waste water treatment.
Identifiers: *Pickle liquor, Equalization, Toronto Ontario.

A waste water treatment plant, consisting of a col lection sump, an equalization basin, iron contac launders, copper settling pits, a clarifier, thickener tank, and a control building, was con structed at a cost of $750,000 to treat spent acid from a brass mill. Dumping volume of spent aci solutions averages 3500 cu ft annually, while 130 cu ft of dichromate is dumped per week. Coppe recovery is practiced in the iron launders and th copper settling tanks. Approximately 5 tons o scrap iron tube are used per month to form 5 ton of copper cementate from which copper metal i recovered. Sulfur dioxide is available to assist in th reduction in the iron launders, but because of th use of shorter lengths of iron tube, and greater tur bulence, the sulfur dioxide is only a supplementar protection. 22 tons of hydrated lime are used eac month both for pH control and coagulant aid. 5 lb 10 oz. of coagulant aid X 1633 are also used dail to reduce the pinpoint floc escaping in the effluen Treated effluent is re-used as cooling water in th plant. Efforts are continuing in the hope o discovering new and better chemicals for coagula tion and neutralization developing improve recovery techniques, and finding a market for 2 tons per month of filter cake sludge. THE TREATMENT OF LIQUID WASTES FRON AN AUTOMOBILE MANUFACTURING OPERA TION,
General Motors of Canada Ltd., St. Catharine (Ontario).
J. A. Watson.
Proceedings, Ontario Industrial Waste Conference 16th, June 1969, Niagara Falls, Ontario, p 90-98.

Descriptors: *Industrial wastes, *Domestic wastes Cooling water, Storm run-off, Sewers, Analytica techniques, Water pollution control, Neutraliza tion, Sedimentation, Flocculation, Coagulation Hydrogen ion concentration, Lime, Oil, Flotation Incineration, Sampling, Turbulence, *Waste wate treatment.
Identifiers: St. Catharines (Ontario).

The Windsor, Ontario plant of General Motors o Canada Ltd. placed the Windsor Treatment Plan on stream in September 1968, approximately years after the initial survey of the waste discharg problem. Technical expertise in the selection an design of the plant was provided at all levels b G.M. engineers who had already experienced thi type of work, in their own plants or elsewhere. Th installation of a major waste treatment plant at a existing factory is both disruptive and expensiv from the plant standpoint. For this particular case separate sewer lines were built to segregate th three main flows of sanitary wastes, cooling an storm water, and industrial wastes, rather than un dertake a major revision of the existing collectio system. For the prevention of accidental discharge

l floor drains were provided with a single outlet ily at the industrial waste treatment plant. Treatent facilities include flocculation and flotation for l and suspended solids removal, with discharge of idge to an incinerator, and supernatant to the indsor sewerage system. This system will serve as pattern for future waste treatment facilities for M's Canadian plants. (Lowry-Texas)

entifiers: *Cyanide.

ushing liquor from a coking process contains, on e average, 3400 ppm COD 2010 ppm total amonia, 185 ppm thiocyanate and cyanide as CNS, 00 ppm total phenols, and 750 ppm of onohydric phenols, while pH averages 8.8. The ree methods of treating phenolic wastewaters inude: (1) evaporation; (2) solvent extraction; and) bacteriological treatment. Since evaporation of enolic compounds pollutes the air and corrodes e surrounding area, and the solvent extraction ocess both costs more and removes less phenol, e bacteriological process was selected to treat the ,000 gallons of liquor produced daily. The plant cludes a storage tank, a two compartment aeran tank, settling tank, innoculum tank, and a steel mp and electrical control housing. Design pacity is 133,000 IGPD which requires a 1:1 dilun before entering the aeration tanks. Addition of osphate is also essential for good biological owth. Start-up difficulties are included in the scussion along with the measures taken to alviate them. Since start-up, not more than 1 hour r day of maintenance has been required, hough 3 hours/day of laboratory time are quired for analyses, and 6 hours/day of operator ne are required for adjustments. Daily electrical quirements have averaged 1320 KWH, and daily osphate cost is $12.00. (Lowry-Texas)

XIDATIVE ASSIMILATION OF NITROGEN-EFICIENT INDUSTRIAL WASTE,
klahoma State Univ., Stillwater.
F. Gaudy, and K. C. Goel.
oceedings, Ontario Industrial Waste Conference, th, June 1969, Niagara Falls, Ontario, p 111-3. 5 fig, 10 ref. USDI Research Grant WP-325.

escriptors: *Industrial wastes, *Nitrogen, utrients, Phosphorus, Chemical oxygen demand, ochemical oxygen demand, Pilot plants, Aeran, Hydrogen ion concentration, Temperature, arbohydrates, Kinetics, Carbon, Sludge, *Waste ater treatment.
entifiers: *Oxidative assimilation, *Endogeneous ration, Glucose, Supernatant.

tch and pilot plant studies utilizing a synthetic rbohydrate waste, a synthetic non-carbohydrate aste, and a nitrogen deficient industrial effluent ere performed to determine the feasibility of eating nitrogen deficient wastes. Present practice cluded nitrogen addition before the aeration nk. The kinetics of the process precluded imediate utilization of the nitrogen, which subquently passed through and into the effluent. owever, by allowing the reaction to proceed under nitrogen deficient conditions, oxidative assimilation removed organic material as stored carbon, which was then reacted with nitrogen during endogenous respiration. Test results showed no leakage of nitrogen to the effluent, and also verified that less nitrogen would be required. The process operated satisfactorily at COD/N ratios of as high as 70 to 1 for the synthetic wastes. This corresponded to more than twice the conventional BOD to N ratios. Further experimentation at plants with this type of waste is needed. Optimum detention times in the feeding and endogenous aerators, optimum recycle solids levels, and the limiting BOD to N ratio have yet to be determined. Although this procedure deviates considerably from standard practice, its benefits are obvious, and it is to be hoped that operating personnel interested in reducing costs and stream enrichment will experiment with it. TREATABILITY STUDIES FOR INDUSTRIAL WASTES,
Prosearch Ltd., Oakville (Ontario).
Robert W. Slater, and Frank Guillame.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, Niagara Falls, Ontario, p 124-140. 15 fig, 1 ref.

Descriptors: *Treatability studies, *Industrial wastes, *Design criteria, Biochemical oxygen demand, Aeration, Oxygenation, Sludge, Mixing, Organic loading, Microorganisms, Activated sludge, Pilot plants, Analytical techniques, Cost analysis, Flexibility, Lagoons, *Waste water treatment.
Identifiers: *Suspended solids, Oakville (Ontario).

Many references contain design criteria which are geared to the average industrial waste of a paper mill, or a chemical plant, etc. However, not only do these criteria lack validity, but the analytical tests upon which they were based are also invalid. Suspended solids and BOD5 are both outdated parameters which must be replaced by particle size characterization and carbon balances respectively, before any progress can be made in achieving true optimal designs. Three case histories are presented, including graphs of both the values expected by conventional design, and the values obtained by using equipment which simulates the actual components. In addition, the variability of industrial processes necessarily leads to a variability of the wastes produced. Changes in production technology may cause the type of waste discharged to literally change overnight. Treatability studies will safely predict the effect of such changes before they are allowed to upset the plant and jeopardize the receiving waters. In this manner, the cost effectiveness of different unit operations can also be evaluated so that more rational decisions and designs will result in cleaner water at less cost to both the populace and the industry. (Lowry-Texas)
W71-08967

GRASS FILTRATION-POND STABILIZATION OF CANNING WASTE, A TWO-STEP PROCESS,
Canadian Canners Ltd., Hamilton (Ontario).
T. G. Stevens, and G. G. Dunn.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, p 161-175. 9 fig, 4 tab.

Descriptors: *Sprinkler irrigation, *Return flow, *Canneries, Industrial wastes, Fruit crops, Strawberries, Peaches, Oxidation lagoons, Screens, *Filtration, Run-off, Evaporation, Percolation, Organic loading, Temperature, Biochemical oxygen demand sub 5, Sampling, Pilot plants, Biodegradation, *Waste water treatment.
Identifiers: St. Davids (Ontario), Canada.

The St. Davids plant of Canadian Canners Ltd. has been in continuous operation since 1896. The processing season begins in mid-June with strawberries, and runs through cherries, apricots, plums and peaches, finishing with pears in late November, with a total processing throughout of 8,000 tons of fresh fruit. Previous treatment consisted of holding the processing waste water in a lagoon over the winter and dumping it into the creek during the Spring thaw when creek flow was maximum. Irrigation was begun in 1958 with a 40 acre field which by 1965 had grown to a 140 acre field which was still too small. A pilot scale study of a series of 5 oxidation ponds was conducted with disappointing results. Finally, it was decided to combine the two systems, with the effluent being irrigated onto the land, and the run-off flowing into a series of stabilization lagoons. An experimental pond measuring 800 ft x 550 ft with a 5 ft depth, was constructed. Since the run-off from the field had BOD sub 5 only 10% of that of the raw waste, the stabilization pond was subjected to light organic loading and functioned well. No cost estimates are available for this system, but it seems to be relatively inexpensive. Work is continuing in an attempt to provide a by-pass directly from the plant to the stabilization pond to prevent large volumes of rainwater from entering the system. (Lowry-Texas)

PRE-TREATMENT OF WASTES AT BARRIE TANNING LIMITED, BARRIE, ONTARIO,
Gore and Storrie Ltd, Toronto (Ontario).
M. Yatabe.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, Niagara Falls, Ontario, p 176-187.

Descriptors: *Industrial wastes, *Organic loading, Biochemical oxygen demand, Hydrogen ion concentration, Sludge, Odors, Temperature, Screens, Aeration, Sedimentation, Anaerobic digestion, Dewatering, Maintenance, Cost analysis, *Waste water treatment.
Identifiers: *Tannery wastes, *Pre-treatment, Suspended solids, Barrie (Ontario).

The treatment plant of the city of Barrie experienced problems including: (1) operational problems in treatment due to extremely high and variable BOD loads; (2) high suspended solids loads resulting in sludge handling problems; (3) odor problems; and (4) excessive maintenance of the sewer downstream of the tannery. A comprehensive program of water conservation was employed at the tannery, resulting in a 30% reduction of the waste flow. The daily volume of waste to be handled stabilized at 185,000 gallons. The plant was designed for primary treatment only, including screening flow equalization, pre-aeration, settling, sludge removal and storage, scum removal, flow metering, tank truck removal of scum and sludge, and dewatering. Limits established for the effluent were: (1) 300 ppm BOD; (2) 350 ppm suspended solids; (3) 100 ppm ether solubles; and (4) pH range of 5.5 to 9.5. From the limited data available so far, for BOD and SS the ranges are from 290 to 600 ppm and 300 to 760 ppm respectively in the effluent. Total cost of this installation was $195,000, with financing arranged by the city. Much improvement in the city treatment plant has been noted, with a reduction in sludge haulage from 15 to 5 truck loads per day. Studies are continuing in the areas of chemical coagulation, sludge concentration, and odor removal. (Lowry-Texas)

TREATMENT OF POTATO PROCESSING WASTES AT SALADA FOODS LTD., ALLISTON,
Ontario Water Resources Commission, Toronto.
T. D. Armstrong, and B. I. Boyko.
Proceedings, Ontario Industrial Waste Conference, 16th, June 1969, Niagara Falls, Ontario, p 188-208.

Descriptors: *Potatoes, *Industrial wastes, Screens, Sedimentation, Organic loading, Activated sludge, Aeration, Dissolved oxygen, Sludge, Oxidation lagoons, Algae, Administration, Maintenance, *Waste water treatment.
Identifiers: *Potato processing wastes, Aerobic lagoons, Anaerobic lagoons.

The Salada Plant at Alliston, Ontario, was constructed in 1959. At this time, 5000 lbs/hr of potatoes were processed into potato flakes during a 24 hour day. Since that time new products have been added, and water consumption, initially 200,000 gpd now ranges from 630,000 to 750,000 gpd during the August to May processing season. The Company and the town were to construct secondary treatment facilities jointly. The initial installation was designed for a waste flow of 150,000 gpd and included screening, sedimentation, an anaerobic lagoon, and two aerobic lagoons. The lagoon filled for 5 1/2 months, and effluent on the first day of overflow was 376,000 gallons with corresponding 6010 lbs BOD. The plant was overloaded both hydraulically and organically, the anaerobic lagoon was changed to an aerobic lagoon, two concrete clarifiers were added, each with 2.75 hours detention time, and bubble gun aeration devices were installed. Since the plant was still over-loaded, a comprehensive survey was ordered, and from the results of this study, a 6.2 hour detention time activated sludge basin was built. Total cost of the treatment plant had risen to $350,000. Although problems were still encountered, this treatment facility provided adequate treatment. Had the necessary long range planning been done earlier, a serious pollutional problem may have been avoided. (Lowry-Texas)

SIMULATION OF AMMONIA STRIPPING FROM WASTE WATER,
Environmental Protection Agency, Cincinnati, Ohio. Water Quality Office.
Joseph F. Roesler, Robert Smith and Richard G. Eilers.
Journal of the Sanitary Engineering Division, ASCE, Vol 97, SA 3, Proc Paper 8182, p 269-286, June 1971. 18 p, 10 fig, 1 tab, 19 ref, 2 append.

Descriptors: *Cooling towers, *Sanitary engineering, *Sewage treatment, Computers, Cost analysis, Reclamation, Water temperature, Waste water treatment.
Identifiers: *Ammonia stripping, Henry's law.

A computer program that can be used for the design and simulation of ammonia stripping and film packed cooling towers was described. The ammonia stripping portion of the program was embedded in the cooling tower circulation in order that the variation of Henry's Law constant with water temperature could be taken into account. The logic of the program was arranged for: (1) Design of cooling towers; and (2) for design of ammonia stripping towers with temperature correction. Two tower configurations were included in the program: (1) Countercurrent in which the liquid flows down and the air moves upward; and (2) Crosscurrent in which the liquid flows down and the air moves horizontally at right angles to the flow of the liquid. Regression equations relating the height of a transfer unit and gas and liquid flow rates were developed from pilot and full scale plant data. Detailed capital and operating cost data were taken from the literature. The computed results indicated that for a crossflow tower an optimum gas to liquid ratio is about 1.75, and for counterflow the optimum is at about 4. Relations between the height of the tower percent removal, cost and influent flow were also examined. It was shown that the total treatment cost levels off between 7 mgd and 10 mgd. (Veverka-Cornell)

PYRITE DEPRESSION BY REDUCTION OF SOLUTION OXIDATION POTENTIAL.
Utah Univ., Salt Lake City. Dept. of Mineral Engineering.
Copy available from GPO Sup Doc, $0.70; microfiche from NTIS as PB-200 257, $0.95. Environmental Protection Agency, Water Pollution Control Research Series Report, December 1970. 50 p, 18 fig, 4 tab, 29 ref. EPA Program 12010 DIM 08/70.

Descriptors: *Separation techniques, *Pyrite, *Flotation, *Reduction (Chemical), Water pollution control, Oxidation-reduction potential, Sulfates, Sulfides, Mining, Acid mine water, Mine wastes, Poisons.
Identifiers: *Mineral separation techniques, Cyanide.

A study of pyrite depression by reducing agents with potassium ethylxanthate as collector indicates that pyrite may be depressed effectively in the flotation of both lead and copper sulfide ores without the use of poisonous cyanide salts. More specifically, the use of sodium sulfite as the depressant may result in metallurgical, economical, environmental and safety advantages over the poison, cyanide. For example, in the case of the copper ore, the best results with cyanide as the depressant were a rougher concentrate recovery of 90.2% and a grade of 4.3% Cu. However, when sulfite was used as the depressant for the same recovery a grade of 7.3% Cu was obtained. (Knapp-USGS)

BEHAVIOR OF NATURAL RADIOACTIVE ELEMENTS IN STANDING RESERVOIRS,
A. A. Iskra, N. V. Kulikov, and V. G. Bakhurov.
Trans from Atominaya Energiya. Soviet Atomic Energy, Vol 27, No 2, p 134-137 (1969). 2 tab, 12 ref.

Descriptors: *Radioactive wastes, *Mine wastes, *Radioactive waste disposal, Uranium radioisotopes, Radium radioisotopes, Lead radioisotopes, Treatment, Water pollution sources, Aquatic plants, Absorption, Detritus, Sedimentation, Lake soils, Aquaria, Biological treatment, Ecology, Soil-water-plant relationships.
Identifiers: Thorium radioisotopes.

Four types of simulated reservoir system were studied through experiments performed in 10 liter glass flasks: (1) lake water, (2) lake water plus soil, (3) lake water plus soil plus aquatic plants, (4) lake water plus plants. The predominant buildup of uranium occured in plant materials, that of thorium occurred in detritus and soil, and that of radium in plant materials. The greatest specific activity and buildup capability is possessed by detritus; to a lesser extent, by plants; and to an insignificant degree, by soil. These results may find practical application for secondary purification of liquid radioactive wastes in artificial storage ponds in which (as a supplement to the main process of sedimentation) uptake of radionuclides by certain types of aquatic plants is used. BIOCHEMISTRY AND PHYSIOLOGY OF DENITRIFICATION BY MARINE BACTERIA,
Georgia Univ., Athens. Dept. of Microbiology.
W. J. Payne.
Available from the National Technical Information Service as AD-721 113, $3.00 in paper copy, $0.95 in microfiche. ONR Final Project Report, 19 Mar 71. 19 p. ONR Project Nonr 3677 (01).

Descriptors: *Bacteria, *Nitrogen fixing bacteria, *Denitrification, *Marine microorganisms, Anaerobic conditions, Aquatic microbiology, Cytological studies, Metabolism, Pseudomonas.
Identifiers: Marine biology, Respiration, Oxidation reduction reactions, Nitrogen, *Anaerobic processes.

P. perfectomarinus was found to grow anaerobically at the expense of nitrate, nitrite or nitrous oxide but not chlorate or nitric oxide. In several repetitive experiments, anaerobic incubation in culture media containing nitrate revealed that an average of 82% of the cells in aerobically grown populations were converted to the capacity for respiration of nitrate. Although they did not form colonies under these conditions, the bacteria synthesized the denitrifying enzymes within 3 hr in the absence of oxygen or another acceptable inorganic oxidant. This was demonstrated by the ability, after anaerobic incubation, of cells and extracts to reduce nitrite, nitric oxide and nitrous oxide to nitrogen. From crude extracts of cells grown on nitrate, nitrite or nitrous oxide, separate complex fractions were obtained that utilized NADH as the source of electrons for the reduction of (1) nitrite to nitric oxide, (2) nitric oxide to nitrous oxide, and (3) nitrous oxide to nitrogen. Gas chromatographic analyses revealed that each of these fractions reduced only one of the nitrogenous oxides.

Descriptors: *Phosphates, *Waste water treatment, *Chemical precipitation, *Anaerobic digestion, Nutrients, Water pollution control, Carbonates, Magnesium, Analytical techniques.
Identifiers: *Phosphate removal.

The effect of magnesium and carbonate on calcium phosphate precipitation was investigated at concentration conditions resembling those in the anaerobic digestion process and at concentration ratios typical of waste waters. The systems were allowed to precipitate at constant temperatures (20 to 30 deg C). The precipitation time was usually 24 hr, but varied from 1 min to several weeks. With magnesium present, the phosphate residual decreased gradually; low values were found at pH above 9. Without magnesium, local minimum and maximum in the residual phosphate were found respectively, at pH 8 and 9.5. Calculated activity products and solids analyses supported a hypothesis of the effect of magnesium on the precipitated solids. Higher carbonate concentrations increased the phosphate residual at pH 8 to 11. The effect was reduced in systems with high magnesium concentrations. (Knapp-USGS)

NEW PROCESS DETOXIFIES CYANIDE WASTES,
H. Martin Malin, Jr.
Environmental Science and Technology, Vol 5, No 6, p 496-497, June 1971. 2 p, 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Oxidation, *Chemical precipitation, Poisons, Chemical reactions, Hydrolysis, Neutralization.
Identifiers: *Cyanides, *Plating wastes.

The widespread use of cyanides--particularly sodium cyanide and hydrocyanic acid--and the extreme toxicity of the free cyanide ion, make adequat

etoxification of cyanide-laden effluents a matter f considerable environmental importance. The rocess most frequently used to decompose cyaides is alkaline chlorination, which may be accomlished in two ways. First, sodium hypochlorite ay be added directly to the waste stream. Cyanide then rapidly oxidized to cyanate. Cyanates can be ompletely converted to carbon dioxide and amonia by acid hydrolysis. Lowering the pH of the ffluent to 2 or 3 to destroy cyanates involves yet nother neutralization of the acidic solution before e effluent can be discharged. Another detoxificaon procedure--electrolytic oxidation--is sometmes applicable when cyanide concentrations are ery high. A novel process which should appeal rimarily to small plant operators oxidizes cyanide om plating wastes to cyanates and simultaneously recipitates zinc or cadmium complexes which can e removed by simple filtration. The key to the rocess is a proprietary peroxygen formulation. It ntains 41% hydrogen peroxide with trace mounts of stabilizers and a small amount of a atented catalytic compound in aqueous solution. perating costs can be as much as 25% below those r alkaline chlorination with hypochlorite. (K-pp-USGS)

HORE EVALUATION OF A PROPRIETARY 0-20 MAN WASTE TREATMENT SYSTEM ESIGNED FOR SHIPBOARD USE,
oast Guard, Washington, D.C. Applied Technolo- Div.
arl L. Schaller, and Thomas S. Scarano.
vailable from the National Technical Information rvice as AD-718 467, $3.00 in paper copy, $0.95 microfiche. Final report, Feb 1971. 19 p, 3 fig. roject No 714122/100.

escriptors: *Waste water treatment, *Activated rbon, Filtration, Adsorption, Aeration, Anaero- digestion, Biochemical oxygen demand, oliforms, Aerobic treatment, Sewage treatment.
entifiers: Shipboard use, Bio-oxidation, Ulaviolet disinfection, Comminutor, Sanitary astes.

shore test program was conducted to determine e effectiveness of a proprietary 10-20 man treatent system designed for shipboard use. The stem investigated made use of activated carbon r the purpose of filtration/adsorption and bio-oxation of sanitary wastes. Influent and effluent aste properties were determined. Physical modifitions were accomplished to convert the mode of eration from aerobic-anaerobic filtran/digestion to acrobic filtration/digestion. Test sults indicated that the system was incapable of eating raw sanitary wastes, primarily because of ugging of the carbon columns with undigested id material.

EGIONAL WASTE WATER, SOLID WASTE SPOSAL, WATER SUPPLY, AND STORM RAINAGE SYSTEMS APPRAISAL.
i-County Regional Planning Commission, Peoria,

vailable from the National Technical Information rvice as PB-196 835, $3.00 in paper copy, $0.95 microfiche. Tri-county Regional Planning Comssion Contract Report, Feb 1970. HUD-Ill-P-3.

escriptors: *Regional analysis, *Water pollution atment, *Planning, *Water distribution, Water pply, Drainage, Population, Storm drains, Waste ter, Sewage treatment, Solid wastes.
entifiers: *Regional planning, *Illinois, Regional anning, Storm sewers, Refuse disposal, *Solid ste disposal, *Peoria County (Ill), *Tazewell unty (Ill), *Woodford County (Ill).

e appraisal of the waste water, solid waste posal, water supply, and storm drainage systems for a three county Region in Central Illinois. Interim guidelines are set forth to guide the Commission in reviewing applications for federal assistance related to any of the four systems. An evaluation of the four systems indicate the present status of waste water and solid waste disposal systems are in need of top priority for planning commission actions. Nearly 80% of the region's 350,000 residents are served by systems which treat the waste water to a population equivalent of only approximately 80,000. Needs and Planning Commission actions are presented for the four systems. A study design is presented for future investigation needed to prepare comprehensive regional plans for these systems.

CONCEPT DEVELOPMENT OF A HEAVY DUTY OIL CONTAINMENT SYSTEM FOR USE ON THE HIGH SEAS.
Atlantic Research Corp., Costa Mesa, Calif. Missile Systems Div.

Available from the National Technical Information Service as AD-719 615. $3.00 in paper copy, $0.95 in microfiche. Concept Development of a Heavy Duty Oil Containment System for use on the High Seas, Volume 1, Final Report, Jan 1971. 247 p, 18 tab, 100 fig, 18 ref. Contract No DOT-CG-00492-A.

Descriptors: *Water pollution control, *Oil wastes, *Oily water, *Cleaning, *Barriers, Ships, Design, Model studies, Test procedures.
Identifiers: *Containment system, Oil booms.

Description and analysis of a model test program and design characteristics of a heavy duty oil containment system are presented. The design is intended for long deployment periods and is capable of air transportation to the area. Large Coast Guard vessels or Navy salvage ships are utilized for deployment. This barrier system guides the oil into a containment area using multi booms for collection and recovery. The barrier is Y shaped formed by 100 foot segments linked together. Each section has two main parts: an inflated cylinder that provides flotation and a water filled submerged skirt for dynamic and static stability. The oil containment phenomena and performance characteristics are discussed. (Ensign-PAI)

NUTRIENT REMOVAL AND ADVANCED WASTE TREATMENT.
Pittsburg Univ., Pa. Graduate School of Public Health.

Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970. 265 p.

Descriptors: *Eutrophication, *Tertiary treatment, *Water quality control, Ammonia, Nitrogen, Phosphorus, Algae, Feasibility studies, Technical feasibility, Economic feasibility, Pilot plants, Ion exchange, Electrolysis, Chemical precipitation, Nitrification, Denitrification, *Waste water treatment.

The 8th Pittsburg Sanitary Engineering Conference was conducted in February of 1970 to assemble current techniques and methods of nitrogen and/or phosphorus removal. A few of the methods presented are: (1) cation exchange; (2) electrolysis; (3) breakpoint chlorination; (4) ammonia stripping; and (5) many others. Removal efficiencies for ammonia, in particular were reported as high as 93%. Systems were tested and retested using various feed rates, system loadings, pH ranges, temperature, etc. Many of the techniques reported not only removal efficiencies but costs in terms of cents/1000 gallons of throughput. For example, column denitrification of water containing 20 mg/l as NO3-N, and using a 3/1 ratio of methanol to nitrogen, was reported at 2.8 cents/1000 gallons for chemicals. By gathering together all of this information and discussing and reproducing it, it was hoped that future lake, river, and stream eutrophication could be prevented by taking preventive action before the waters are destroyed or irreparably damaged. PHOSPHORUS REMOVAL BY CHEMICAL ADDITION DURING PRIMARY TREATMENT,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Richard C. Brenner.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 29-36. 17 fig.

Descriptors: *Phosphorus, *Chemical precipitation, *Biological treatment, Iron, Aluminum, Lime, Chemicals, Effluent, Trickling filter, Activated sludge, *Waste water treatment.
Identifiers: Polymers.

The current approaches for removing major fractions of phosphorus from waste water are: maximization of biological removal, straight chemical precipitation, and combined chemical-biological interaction using mineral additions. The chemicals used for phosphorus removal in the primary tank are: iron salts plus base plus or minus polymer, aluminum salts and polymer and lime. In the secondary system, iron salts and aluminum and activated aluminia columns are used. The choice of chemicals depends on many factors such as, influent phosphorus level, effluent discharge standard, plant size, etc. The advantages of phosphorus removal in the primary systems are listed. Experimental results employing iron precipitation in the primary sedimentation basin in primary plants, trickling filters and activated sludge plants are all listed and illustrated in various figures. ADVANCED WASTE TREATMENT AT WASHINGTON, D.C.,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Thomas P. O'Farrell, Dolloff F. Bishop, and Stephen M. Bennett.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 99-129. 5 fig, 7 tab, 4 ref.

Descriptors: *Waste water treatment, *Filtration, *Stabilization, Adsorption, Chlorination, Sludge, Lime, Flow diagram, Precipitation, Weirs, Flocculation, Turbidity, *District of Columbia.

The advanced treatment pilot plant consists of: chemical clarification, filtration, water stabilization, carbon adsorption, chlorination, sludge disposal, and a chemical recovery system. Description of all the above units along with a flow diagram is presented. The complete advanced treatment with two-stage lime precipitation and ferric addition to the second clarifier removed 95%

phosphorus and 95% TOC from a minimum quality DC. secondary effluent. The average residual of phosphorus was 0.4 mg/l, 2.3 mg/l, TOS and .4 units turbidity. The replacement of the ferric flocculant reduced the average total removals to 94% phosphorus and 92% TOC with a turbidity of 1.6 units. In all two-stage operations the slurry pool in the first clarifier was unstable, with subsequent expansions causing periodic overflow of the weirs. These overflows were captured in the second clarifier. The single stage (pH 11.5) removed 96% phosphorus and 86% TOC, while lime alone removed 92% phosphorus and 51% TOC. The efficiency of the filtration system depended on the efficiency of the clarification system. The dual media filter runs averaged 59 hours and the sand filter runs averaged 32 hours. Adsorption removed 75% of TOC in low turbidity. The carbon loading factor averaged 0.133 lb TOC/lb carbon for 12 x 40 mesh carbon. (See also W71-09450) (Rayyan-Texas)
W71-09452

PHOSPHORUS REMOVAL BY ALUM AND IRON CLARIFICATION,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Carl A. Brunner.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 129-130.

Descriptors: *Phosphorus, *Aluminum, *Iron, Hydrogen ion concentration, Economics, Pilot, Flocculation, Activated sludge, *Waste water treatment.
Identifiers: Clarification, Calcination.

Orthophosphate is effectively removed by alum and iron salts. 80% phosphorus removal was achieved using an iron to phosphorus ratio of 1:1, while 80% removal with alum required an alum to phosphorus ratio of 1.2 to 1. The most effective pH is 6 for Al and 4 or less for ferric ion. Polyphosphates are also removed, but less effectively, by iron and aluminum. Conventional upflow or longitudial clarification equipment can be used for phosphorus removal using alum or iron salts. Phosphorus removal with iron or alum is technically possible but not economical. However, this method could be used economically at small plants or as a phosphate polishing process. ALTERNATIVE METHODS FOR PHOSPHORUS REMOVAL,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Carl A. Brunner.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Nutrient Removal and Advanced Waste Treatment, Feb 1970, p 131-134.

Descriptors: *Phosphorus, Nutrients, Tertiary treatment, Nitrogen, *Chemical precipitation, *Absorption, *Anion exchange, Sedimentation, Separation techniques, Ion exchange, Semi-permeable membranes, Resins, Hydrolysis, Solubility, Cost analysis, Technical feasibility, Economic feasibility, *Waste water treatment.
Identifiers: *Regeneration.

The three major phosphorus removal mechanisms discussed are: (1) sorption on activated alumina; (2) precipitation with Lanthanum salts; and (3) anion exchange. Absorption has been more extensively investigated. Phosphorus is the only nutrient removed, and a preliminary cost estimate is 5-6 cents/1000 gallons, based upon regeneration of the alumina, and lime precipitation of the eluted phosphate and other impurities allowing re-use of the NaOH regenerant. Lanthanum precipitates only orthophosphates, and using a La:P ratio of 1:1, residual P concentrations of .01 mg/l can be obtained at pH between 5 and 9.0. Sufficient Lanthanum hydrolysis takes place to prevent any Lanthanum from being lost in the effluent. A recovery method for recovering the expensive Lanthanum must be developed, if such a recovery scheme exists, before the process becomes economically feasible. Anion exchange columns have the capability to remove both phosphorus and nitrogen. Presence of other anions in domestic waste water was shown to have no effect on the rate at which nitrogen and phosphorus ion were exchanged. However, lime precipitation of the regenerant would remove only the phosphates causing a nitrogen buildup, necessitating disposal of some of the brine, and resultant disposal problems. Preliminary cost estimates have set costs for anion exchange at 10 cents/1000 gallons for a 10MGD plant. Pilot scale studies are continuing to provide more accurate information. W71-09454

RE-USE AND DISPOSAL OF ALUM AND LIME SLUDGES,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Robert B. Dean.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 135-145. 4 fig, 13 ref.

Descriptors: *Sludge disposal, Water chemistry, Water softening, Hardness (Water), Chemical precipitation, Phosphates, *Lime, Dewatering, Freeze drying, Solubility, Filtration, Pressure, Temperature, Incineration, Digestion, Cost analysis, Technical feasibility, Economic feasibility, *Waste water treatment, *Water reuse.
Identifiers: *Chemical recovery, *Alum, Re-carbonation.

Both lime and alum precipitation reactions produce sludge which must be handled in some manner. First of all, the choice must be made as to whether the sludge is to be disposed of or treated for re-use of the chemicals in it. 250 mg/l of lime produces 500-600 mg/l of sludge with and underflow concentration of 2-3% or 2 tons of sludge solids per mgd. This sludge may be used for soil stabilization, fill for roads, or in agriculture. However, by heating the precipitated calcium carbonate, calcium oxide can be recovered and re-used. The cost of lime recovery is the same as the cost of new lime, but disposal costs are significantly reduced. Costs reported from Dayton, Ohio are $10-$12 per ton, while the Lake Tahoe plant reports lime recovery as costing $20/ton. The results of testing 4 laboratory scale, 75 liter treatment systems are reported and compared with regard to phosphate removal, sluge dewaterability, sludge filterability, and sludge composition. Alum sludges contain 2 Al:1P and probably some Ca plus some organic matter. The sludge will settle to 10% solids, and is amendable to concentration by freezing. The sludge is not biodegradable, and can sometimes cause clogging of the soil when disposed on the land. Lime treated alum sludge can be filter pressed to remove in excess of 50% as soluble aluminate, however, incineration of alum sludge leaves little or no residue for disposal, so for alum, disposal may be less expensive than re-use. (See also W71-09450) (Lowry-Texas)
W71-09455

DISPOSAL AND RE-USE OF LIME SLUDGE,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Dolloff F. Bishop, and Stephen M. Bennett.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 147-179. 14 fig, 4 tab, 8 ref.

Descriptors: *Chemical precipitation, *Turbidity, *Phosphorus, Sludge, Lime, Calcium carbonate, Slaking, Temperature, Hydrogen ion concentration, Pressure, Permeability, Filtration, Vacuum drying, Incineration, Design criteria, District of Columbia, Waste water disposal, Water reuse, *Waste water treatment.
Identifiers: *Thickening, *Recalcination.

Recalcination and re-use of lime allows the buildu of inert materials which generally improve th thickening and dewatering yield of the sludge, bu decrease the Available Lime Index (ALI) and th slaking temperature. Data to indicate whether o not a minimum solids wasting rate for satisfactor slaking occurs is not available. Recovery and re-us has always included some wastage to prevent hig levels of inerts from building up. For lime processe at pH 11.5, solids loading and composition may b estimated from precipitation reactions, waste wate component analyses, and the solids wasting rate At the lower pH range of 9-10, this informatio must be obtained from jar tests. Lime sludg characteristics are dependent upon: (1) calcium carbonate content; (2) amount and type of non carbonate solids removed; and (3) amount of recy cled inert solids. Slight sludge characteristic changes produce wide variability in thickening an dewatering yields. Thickening of modified secon dary lime sludge from the FWPCA-DC pilot plan with a 75% CaCO3 content produced thickene sludge of 20% solids by weight, and filter yields o 15 lbs dry solids/ft2/hr. By contrast, primary lim sludges thickened to only 10% solids and produce filter yields of 2lbs dry solids/ft2/hr. Therefore, on site laboratory thickening tests and filter leaf test on typical sludge are essential to the formulation o a rational design. (See also W71-09450) (Lowry Texas)

BIOLOGICAL NITRIFICATION AN DENITRIFICATION,
Robert A. Taft Water Research Center, Cincinnati Ohio. Advanced Waste Treatment Research Lab.
Edwin F. Barth.
Proceedings, Pittsburg Sanitary Engineering Con ference, 8, Pittsburg, Pennsylvania, Feb 1970, 181-193. 7 fig, 3 tab.

Descriptors: Nutrients, *Nitrogen, *Phosphorus Nitrification, Denitrification, Ammonia, Chlorina tion, Disinfection, Biochemical oxygen demand Nitrogen compounds, Alcohols, Carbon dioxide Efficiencies, Corrosion, Aluminum, Sludge, Public health, Waste water treatment.
Identifiers: *Suspended solids.

Nitrogen in waste waters has been associate mainly with algal blooms. However, the BOD o most secondary effluents is due mainly to am monia, oxidized nitrogen is a serious consideratio in groundwater recharge situations, and both am monia and oxides of nitrogen interfere witl chlorine disinfection of water. Therefore, growin emphasis is being placed on removal mechanism for nitrogen. However, chemical precipitation an biodegradation, two major methods for phosphoru and suspended solids and organic removal respec tively, have been demonstrated to have little or n effect on nitrogen compounds. Therefore pilo plant studies have been initiated at Manassas, Vir ginia, Archbold, Ohio, and at Notre Dame Univer sity, South Bend, Indiana. These pilot plants have consisted of multi-stage treatment for biologica nitrification and denitrification, with some of th studies providing concurrent removal o phosphorus also. The highest % removal efficienc of nitrogen compounds reported here is 61% which was achieved at the Archbold, Ohio installa tion. No cost estimates were tabulated since cos data has so far been relatively insufficient. (Se also W71-09450) (Lowry-Texas)
W71-09457

DENITRIFICATION OF SOLID MEDIA,
Robert A. Taft Water Research Center, Cincinnati Ohio. Advanced Waste Treatment Research Lab.
Richard C. Brenner.
Proceedings, Pittsburg Sanitary Engineering Con ference, 8, Pittsburg, Pennsylvania, Feb 1970, 195-221. 19 fig.

Descriptors: *Denitrification, *Nitrate, *Activate carbon, Adsorption, Efficiencies, Temperature Pressure, Dissolved oxygen, Head loss, Filtration Turbidity, Chemical oxygen demand, Color, Odor Nutrients, *Waste water treatment.

dentifiers: *Methanol, Backwashing, Climatic onditions.

The accidental discovery that 50% nitrification ould be achieved without chemical inducement in arbon columns stimulated investigations in this rea. Since then pilot plants have been constructed t Firebaugh, California, Pomona, California, ebanon, Ohio, and other locations. Both packed ed downflow and upflow columns have been ested. Results indicated that although upflow olumns need very little backwashing, they also ust be operated at surface loading rates of around 4 gpm/ft2 and have a contact time of one to two ours. Downflow columns, on the other hand, must e backwashed regularly, but are able to operate at gpm/ft2 with a 10 minute or less contact time. Methanol was used as a substrate for all investigaons reported, with optimum level of methanol stablished at 3 times the nitrate concentration. 'arying media sizes seemed to have little effect on ne process. Further work is needed to quantify the ffect of varying temperature. Several modificaons of the denitrification process, including open ank denitrification, are included. For column enitrification of a water having influent NO3 of 20 ng/l and using an M/N ratio of 3/1, chemical costs veraged 2.1 cent/1000 gallons. For open tank enitrification of the same influent with M/N—4/1, hemical costs were reported to be 2.8 cent/1000 allons. No cost estimates for equipment were vailable owing to the diversity of processes. (See lso W71-09450) (Lowry-Texas)
V71-09458

THER METHODS OF NITRATE REMOVAL,
obert A. Taft Water Research Center, Cincinnati, hio. Advanced Waste Treatment Research Lab.
. B. Dean.
roceedings, Pittsburg Sanitary Engineering Conerence, 8, Pittsburg, Pennsylvania, Feb 1970, p 23-227. 1 fig, 6 ref.

escriptors: *Denitrification, *Nitrates, Ammonia, itrites, *Ion exchange, Nutrients, Separation echniques, Nitrogen fixing bacteria, Tertiary treatent, Brines, Toxicity, *Waste water treatment, Ions.
dentifiers: Nitrosomonas, Nitrobacter, egenerant, Extended aeration.

The major forms of nitrogen in secondary effluents nclude: (1) ammonia-ammonium ions; (2) nitrite ons; and (3) nitrate ions. Ammonia is produced rom urea and other organic nitrogen in sewage. There is an average of 14 mg/l of ammonia-amonium ion in sewage and the recommended efuent limit is 1 mg/l as N. Nitrite ions are roduced from ammonia and CO2 by nitrosomanas acteria when organic food is low. Nitrite ions verage 0.4 mg/l as N in secondary effluent, and heir recommended limit is 1 mg/l as N. Nitrate ons are produced from nitrite and CO2 by itrobacter, and this readily occurs in streams. itrate ions average 2.7 mg/l in secondary effluent nd their PHS limit is 10 mg/l as N. Ammonia and itrates are rarely both at high levels in one reactor. mmonia is more prevalent in high rate systems, hile nitrates are more commonly associated with xtended aeration systems. Nitrate removal with on exchange is technically feasible, but problems ssociated with disposal of regenerant brines have mited its application. Nitrates may also be emoved by chemical precipitation with ferrous alts, but again the procedure is limited to situaons where ferrous salts are cheap and there is a onvenient dump for the precipitates. Costs for onspecific resins are 18 cent/1000 gallons plus rine disposal, 12 cent/1000 gallons for specific esins, and 4.5 to 8.5 cent/1000 gallons plus the ost of sludge disposal for chemical reduction. All osts are based on influent nitrogen of 20 to 10 ng/l or less for a 10 mgd plant. (See also W71-9450) (Lowry-Texas)
V71-09459

AIR STRIPPING OF AMMONIA,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. B. Dean.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 229-231.

Descriptors: *Ammonia, *Nitrogen, *Solubility, Cooling towers, Carbon dioxide, Lime, Hydrogen ion concentration, Temperature, Cost analysis, *Waste water treatment.
Identifiers: *Air stripping.

Ammonia can be stripped from a solution by bubbling air through it only if the pH is first raised to 11.0 to convert the free ammonium ion to ammonium hydroxide. Ammonia, however, is over 1000 times more soluble in water than is CO2, necessitating a theoretical minimum of 220 ft3 of air for 90% ammonia removal from 1 gallon of water at 20C. Stripping towers become, in essence, water cooling towers, with subsequent cold weather operation difficulties. Also, the solubility of ammonia is increased with decreasing temperature, compounding the problem. Actual performance data from the Lake Tahoe plant indicate that under plant operation conditions, 300 ft3/gallon are actually required. In addition, calcium carbonate scale is formed by reaction with CO2 which must be removed. Reducing the ammonia content of a fluid from 20 mg/l to 2 mg/l would cost 2.3 cents/1000 at pH 11 and 9.9 cents/1000 gallons if the cost of the lime required to raise the pH to 11 is included. These costs are based on a 10 MGD plant, and they do not include scale removal. (See also W71-09450) (Lowry-Texas)
W71-09460

REMOVAL OF AMMONIA BY SELECTIVE ION EXCHANGE,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. B. Dean.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 233-238. 2 fig, 5 ref.

Descriptors: *Ammonia, *Ion exchange, Zeolites, Selectivity, Resins, Nitrogen, Temperature, Hydrogen ion concentration, Lime, Adsorption, Calcium carbonate, Cooling towers, Brines, *Waste water treatment.
Identifiers: *Regenerant, Stripping.

Zeolites have been developed which are selective for ammonia. At a given fraction of NH ..4 in solution, the fraction of NH ..4 on the ion exchange material is much higher for the Hector clinoptilolite than for the conventional ion exchange resin, IR 120. Ammonium ion-specific zeolites are poor adsorbents for Caions, and therefore can be regenerated with limewater. Caions replace ammonium ions on the resin, and the high pH produces un-ionized NH3 from the NH ..4 ions. Sodium ions present in the solution act to speed up the regeneration. Limewater regenerant can be stripped of ammonia in packed columns or cooling towers, since volumes are 5% or less of the total flow, the water can be settled to remove calcium carbonate, replenished with lime, and re-used. There is no waste brine. Cost of ammonia removal by non-selective resins is estimated at 8.1 cent/1000 gallons, with the cost of brine disposal not included. Cost for selective zeolites are reported as between 3 and 6 cent/1000 gallons, with no brines to be disposed of, when treating 15-20 mg/l NH4-N. (See also W71-09450) (Lowry-Texas)
W71-09461

NITROGEN REMOVAL BY BREAKPOINT CHLORINATION,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Dolloff F. Bishop, and Thomas A. Pressley.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania Feb 1970, p 239-247. 3 fig, 1 tab, 6 ref.

Descriptors: *Chlorination, *Ammonia, *Nitrogen, Oxidation, Nitrogen cycle, Hydrogen ion concentration, Hydrolysis, Neutralization, Alkalinity, Acids, Pilot plants, Cost analysis, Storage, Nitrates, *Waste water treatment.
Identifiers: Breakpoint chlorination, Chloramines, Chlorine residual, Caustic.

Ammonia oxidation by 'breakpoint' chlorination provides a physical-chemical means for removing ammonia and completing the natural nitrogen cycle (i.e., oxidation of the ammonia to N2). Chlorine is added to the ammonia water until chlorine residual has reached a minimum and ammonia nitrogen has entirely disappeared. This method has been used for many years in the water industry and has been found to be pH dependent, with efficient breakpointing occurring only at pH 7-8.5. In natural water, non-ammonia chlorine demand may call for a chlorine to ammonia-nitrogen weight ratio of 15 to 1 or greater. Disadvantages of the method include: (1) satisfactory nitrogen removals may not be achieved if greater than 1 mg/l of permanent residual nitrogen compounds occur such as NO3-; (2) large chlorine doses produce more acid by chlorine hydrolysis than can be neutralized by most waste waters, necessitating the addition of caustic to maintain a favorable pH range; (3) high chlorine demands require increased supplies of stored chlorine which represent a potentially hazardous condition; and (4) at chlorine costs of $0.05/lb and a 200 mg/l dose, the cost for the chlorine alone is 8.3 cents/1000 gallons. However, if pilot plant studies establish that acceptable removals can be obtained, on-site chlorine generation from bines, which produces both chlorine and caustic, may overcome the caustic and storage problems in large plants. The operation simplicity alone recommends the method for small plants. (See also W71-09450) (Lowry-Texas)
W71-09462

OTHER METHODS OF AMMONIA REMOVAL,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Carl A. Brunner.
Proceedings, Pittsburg Sanitary Engineering Conference, 8, Pittsburg, Pennsylvania, Feb 1970, p 249-250.

Descriptors: *Ammonia, *Nitrogen, Feasibility studies, Economic feasibility, Technical feasibility, Ion transport, Resins, Electric currents, Anodes, Cathodes, Stainless steel, Lime, Hydrogen ion concentration, *Waste water treatment.
Identifiers: *Ligands, *Complexes, Ammonia stripping, Regenerant, Platinum.

Three relatively new theoretical methods of ammonia removal are presented with reports on the various stages of developmental progress. Ligand exchange utilizes the fact that ammonia can form a cupro-ammonium complex, with 4 ammonium ions attaching to one copper ion. Attaching the ions to a resin bed would allow the ammonia water to be passed through and the ammonia to become complexed with the copper ions. With exhaustion of all complexing sites, the bed would have to be regenerated, and ammonia might possibly be recoverable from the concentrated regenerant. This method is only in the concept stage, with a laboratory feasibility study to start soon. Electrolytic oxidation of ammonia to elemental nitrogen involves the use of an electrolytic cell, platinum anodes, stainless steel cathodes, and cell voltages in the range of 0.5 volts. Current densities of less than 1 ma/om2 result in large electrode areas which, due to the high cost of platinum, make the method uneconomical. Research is continuing on a method of alloying platinum with other metals to reduce the cost. Finally, laboratory scale investigations of cation exchange membranes have produced as high as 93% removal of ammonia from synthetic waste water containing only sodium and ammonium cations. Alternate compartments in a stack would contain regenerant which would allow cations to replace the ammonia across the mem-

brane. Lime treatment and air stripping would remove gaseous ammonia and allow the regenerant to be re-used. (See also W71-09450) (Lowry-Texas)

AMMONIA STRIPPING AT WASHINGTON D.C.
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Thomas P. O'Farrell, and Francis P. Frauson.
Proceedings, Pittsburg Sanitary Engineering Conference, 8th, Pittsburg, Pennsylvania, Feb 1970, p 251-263. 5 fig, 2 tab, 1 ref.

Descriptors: *Cooling towers, *Ammonia, Temperature, Scaling, Calcium carbonate, Chemical precipitation, Lime, Aeration, Biochemical oxygen demand, Flocculation, Nitrification, Alkalinity, Hydrogen ion concentration, Phosphorus, Teratiry treatment, *Waste water treatment, *District of Columbia.
Identifiers: *Ammonia stripping.

An ammonia stripping system, consisting of 5 towers, each packed with 40, 4 ft x 5 ft x 1/2 inch grids, was subjected to a 75 day test. The efficiencies of ammonia removal were determined at various air to liquid (G/L) rates. Liquid loadings were restricted to 1 gpm/ft squared due to the fan capacity. The data was combined to formulate an empirical curve which indicated that 500 ft cubed of air per liquid gallon is required for 90% ammonia removal. Temperatures averaged 78 and 77F for inlet air and water respectively, and pH ranged from 11.8 to 12.0. Accumulation of calcium carbonate in the system forced intermittent shutdown of the system for maintenance. Air to liquid rates decreased from an initial 350 ft cubed air/gallon of liquid to a final 250 ft cubed air/gallon of liquid, thus decreasing the efficiency of the system for ammonia removal, also on account of calcium carbonate buildup in the towers. A 20% system efficiency decrease toward the end was attributed to falling temperatures. Total scale accumulation in the towers was 2 tons, with each grid requiring manual cleaning. Removal of the CaCO3 also upset the chemical clarifier system. From these tests it was determined that scale deposition and reduced temperatures for part of the year preclude ammonia stripping as a feasible nitrogen removal mechanism in Washington, D.C. ECONOMICS OF COMPOSTING MUNICIPAL REFUSE IN EUROPE AND ISRAEL,
American Public Health Association, New York.
G. J. Kupchik.
Proceedings of the American Society of Civil Engineers Journal of the Sanitary Engineering Division, Proceedings of ASCE, Vol. 92, No. SA6, p. 41-56, December 1966, 4 tab.

Descriptors: *Economics, *Disposal, *Costs, Operations, Survey, Amortization, Evaluation, Interest, Maintenance, Utilities, Income, Fertilizers, Atmospheric pollution, Soils, Refuse, Production.
Identifiers: *Composting municipal refuse, *Pulverization, Salvage, Sale, Land rental, Reserve fund, Processes.

This report came from a survey of various composting systems used in Europe and Israel, under different climatic, economic, and social conditions, by the author in 1965. The most common composting processes are Van Maanen process, Rasping system, Ventilated cell composting, Dano system, and Buhler system. Cost and income data collected from 14 composting plants included amortization, interest, reserve fund, land rental, personnel, utilities, maintenance and repairs, disposal of rejects, miscellaneous costs, salvage, and compost production and sales. Cost analyses was made to determine factors favoring successful operation. Tabulated data were costs of processing raw refuse, costs of processing raw refuse utilizing different composting systems, production and sale of compost, and comparison of costs for pulverizing and composting raw refuse. Applicability of composting refuse to the United States was discussed. Additional research and demonstration projects in refuse disposal methods are urgently needed. (Wang-Rutgers)

WASTE DISPOSAL IN DEEP WELLS.
National Industrial Pollution Control Council, Washington, D.C.

For sale by the Superintendent of Documents, US Government Printing Office, Washington DC 20402--Price $0.25. National Industrial Pollution Control Council, Sub-Council Report (Feb 1971). 20 p, 1 tab.

Descriptors: *Waste disposal, *Injection wells, *Industrial wastes, *Research and development, Geologic investigations, Legal aspects, Risks, Well regulations, Monitoring, Geological surveys, Standards, Classification, Geographical regions, Ultimate disposal, Waste identification, Damages.

The growing chemical complexity of waste products coupled with the severity of pollution standards has caused industry to view deep well disposal as possibly the only logical method for disposing of certain untreatable wastes. The National Industrial Pollution Control Council recommended immediate research by the federal government and industry to establish: (1) the geological factors involved in deep well disposal, (2) identification of all areas in the country amenable to this form of disposal, (3) a categorization of all wastes and their suitability for deep well disposal, (4) the legal status of deep well disposal, and (5) suitable procedures for monitoring deep wells and disposal areas. Using deep well waste disposal raises several legal questions. When does underground trespass start. To what degree and extent are the users liable for surface or subsurface damage to nearby properties. Who owns water-injected and groundwater recharge. The use of deep well disposal hasn't been sufficiently extensive to establish precedent as to legal responsibilities arising therefrom. Statutory regulations throughout the country are diverse, and ambiguity as to legal responsibilities deters widespread use of this method. (Gallagher-Florida)

TESTING AND EVALUATION OF OIL SPILL RECOVERY EQUIPMENT.
Main Port Authority, Portland.

Copy available from GPO Sup Doc as SOD No EP 2.10:15080 DOZ 12/70, $1.50; microfiche from NTIS as PB-200 081, $0.95. EPA Report, Dec 1970. 162 p, 27 fig, 25 ref. FWQA Program no 15080 DOZ.

Descriptors: *Oil, *Separation techniques, Oil-water interfaces, Secondary recovery (Oil), Flotation, Evaporation, Currents, Turbulence, Test procedures, Measurements, Water pollution control, Water quality control.
Identifiers: *Oil spill recovery equipment, Curtain booms, Fence booms, Air barriers, Skimmers, Rate of rise.

The Gulf of Mexico, in March 1970, was the scene of a major equipment testing and evaluation study of oil spill control and recovery equipment. The tests took place during 30 knot winds, and 8 ft waves. The oil recovery equipment tested included mechanical barriers, air barriers, and skimming equipment. A detailed report containing both the test results on the capacilities and limitations of the various equipment types tested, and also recommendations on needed improvements was prepared. It was strongly recommended that adequate skimming capacity could be installed and maintained in close proximity to all major industries which would be considered potential oil spill hazards. Recommendations were also prepared concerning the methods of enlisting community aid, both in helping to support the installation of oil spill recovery equipment, and also in working to clean up such spills as do occur. Only through complete co-operation of population and industry can damages from oil spills be minimized, and both the technology and the guidance are now available to safeguard the marine environment and our recreational facilities from irreparable losses. EFFECTS OF CONTAMINANTS ON REAERATION RATES IN RIVER WATER,
Illinois State Water Survey, Peoria.
V. Kothandaraman.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 806-817. 3 fig, 8 tab, 15 ref.

Descriptors: *Aeration, *Oxygenation, Rivers, Analytical techniques, Regression analysis, Sampling, Instrumentation, Dissolved oxygen, Saturation, Adsorption, Hydrogen ion concentration, Chemical oxygen demand, Biochemical oxygen demand, *Water quality control, Wastes, Illinois, Waste water treatment.
Identifiers: *Reaeration rate coefficient, Illinois River.

The reaeration rate constant has been shown to depend not only upon the presence or absence of various constituents in the water, but also upon the method used to calculate the constant. River water samples were taken, adjusted to pH 3.0 to suppress biological activity, and subjected to reaeration. Dissolved oxygen probes were used to measure dissolved oxygen concentrations. The Reed Theriault method afforded a unique value for K2 without

equiring knowledge of dissolved oxygen saturation oncentration. However, the gradient method is he best of all the available methods for evaluating he parameters of first-order reactions. The conminants in the river water were discovered to ter the reaeration rate to the extent of plus or inus 15% as compared with distilled water. Howver, no specific relationship between the reaeraon rate co-efficient and constitutent contaminants river water was discovered which was applicable r all mixing conditions. (Lowry-Texas)

escriptors: *Estuaries, *Ecosystems, Water esources development, Recreation, Estuarine sheries, Legislation, Water quality control, Adinistration, Water pollution control, Contract adinistration.

he Federal Water Pollution Control Administraon established the Estuarine and Oceanographic rograms branch to carry out a study on pollution f the nation's estuaries. To facilitate this study, 30 ublic meetings were held in the various estuarine ones of the country and its possessions, and 22 ontracts were negotiated to obtain specialized inrmation. In addition, an automated information orage and retrieval system, the national estuarine ventory was developed. Some basic assumptions ade by the national estuarine pollution study inuded the formation of an expanded, long range rogram to encompass the estuarine and coastal ones. Recommendations proposed by the study inuded suggested policies for local, state, and naonal governments, as well as for interested public nd private interest groups. Support of all private terest groups and all regulatory agencies is eeded in any protection plan to help alleviate the ollution already present and also to prevent rther pollution, before the fragile ecosystems of ur nation's estuaries and coastal areas degenerate eyond repair. umping of dredged solids into lakes has created any problems with respect to the aquatic environents present. An alternative to dumping these redged solids back into bodies of water is land isposal. To avoid dumping in Lake Michigan, ,000 acres will be needed at least. In highly uranized areas, such acreages of land are not readily vailable, and some method of transporting the aterial to the dumping site is necessary Since a ipeline is possibly the most logical solution, the ow behavior of shoal deposits of up to 25.5 wt% as investigated in 0.5 and 1.0 inch pipelines. Pressure drops at various conditions were measured nd used to formulate an empirical relationship for ressure drop as a function of several variables. Acuracy of this relationship was determined to be lus or minus 5%, and it was mainly recommended or suspensions in the turbulent flow region where he shear stress-shear rate relationship for laminar low cannot be applied. A Brookfield viscometer was used to determine flow parameters at solids concentrations of up to 27.1 wt%. Flow curves obtained were checked with experimental curves, and the curves showed Bingham plastic behaviour, with strong plasticity occurring with suspensions of greater than 10 wt% solids. COMBINED SEWER REGULATION WITH FLUIDIC REGULATION,
Bowles Fluidics Corp., Silver Spring, Md.
Peter A. Freeman.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 662-871. 12 fig, 3 ref.

Descriptors: *Storm run-off, *Sewers, *Water pollution control, Flow control, Hydraulic structures, Orifices, Pipes, Headloss, Weirs.
Identifiers: *Fluidics, Static diversion strucutres, Combined sewers, Aspiration, Electromechanical, Electrohydraulic.

Combined storm water overflow has become a significant pollutional load on stream, rivers, and lakes in many areas. One of the reasons noted for this was poor flow regulation devices in many areas. Nearly all the equipment which was simple to install and required little or no maintenance also provided less than adequate flow control. Application of the fluidic concept, however, seems to present several distinct advantages: (1) fluidics elements offer the much improved flow regulation formerly possible only with float-operated units or the large electromechanical or electrohydraulic units; (2) fluidics units operate without mechanical moving parts; (3) fluidics elements can be easily adapted to structures in existing plants; and (4) fluidics installations offer the operational reliability and minimum maintenance and surveillance costs of static diversion structures. Fluidics elements, therefore combine the best features of most of the existing equipment types at a modest cost. (Lowry-Texas)

TOWARDS BETTER ADMINISTRATION OF WATER QUALITY CONTROL,
Robert L. Haskins.
Oregon Law Review, Vol 49, No 4, p 373-393, 1970. 21 p, 147 ref.

Descriptors: *Water quality control, *Water pollution control, *Water pollution treatment, *Waste water (Pollution), Water quality, Impaired water quality, Standards, Water resources, Water purification, Rivers, Water treatment, Tertiary treatment, Sewage treatment, River basins, Running waters, Regulation, Legal aspects, Water policy, Water rights, Waste water disposal, Water pollution, Water supply.

Administration of water quality control is the central subject of this note. Primary treatment, secondary treatment, tertiary treatment, and lagooning are discussed as methods of pollution control. The following administrative approaches to water quality control are examined: (1) stream standards, (2) effluent standards, (3) subsidies, and (4) effluent charges. Streams standards are not self executing and do not allocate a river's assimilative capacities except by haphazard enforcement. Effluent standards enforcement is of such a complex nature that states have used uniform standards. This assures some abatement by all but fails to consider abatement cost differences or availability of alternative methods, thus causing greater than optimal cost results. The use of subsidies is a low incentive method of water control. The author feels that the biggest failure of the stream standards, effluent standards, and subsidies approaches has been their failure to deal with external diseconomies. The author concludes that the effluent charges approach provides the missing incentives and the most rational comprehensive method of allocating water quality control responsibility. (Robinson-Florida)

RANSOMING THE MAINE ENVIRONMENT,
G. Graham Waite.
Maine Law Review, Vol 23, No 1, p 103-118, 1971. 16 p, 69 ref.

Descriptors: *Maine, *Pollution abatement, *Riparian rights, *Public rights, Judicial decisions, Water pollution, Water pollution control, Eminent domain, Compensation, Land tenure, Administrative agencies, State jurisdiction, State governments, Local governments, Riparian land, Reasonable use, Competing uses, Municipal water, Navigable waters, Relative rights, Remedies, Waste disposal, Watershed management, Streams, Political aspects, Legal aspects.

A study of court decisions in Maine indicates that the police power has been restricted to a narrow role in state programs for protecting natural resources, and thus has made a clean environment hostage to private property. Two specific decisions pose a serious threat to water pollution control through the police power. These decisions limited the jurisdiction of the Water and Air Environmental Improvement Commission over new pollution to that coming from land within the watershed of the polluted watercourse. The cases have also applied a narrow and unnecessary test of navigability of the watercourse. These decisions rest on the conception that if government suspends the exercise of any individual riparian right, property has been taken and compensation must be paid. Some decisions dealing with property concepts and eminent domain are also examined. Placing the bulk of environmental rehabilitation costs initially on the taxpayer in the form of compensation awards dims the prospects for an effective state program for environmental improvement. (Smiljanich-Florida)

CONSTITUTIONAL DILEMMAS POSED BY STATE POLICIES AGAINST MARINE POLLUTION--THE MAINE EXAMPLE,
Daniel Wilkes.
Maine Law Review, Vol 23, No 1, p 143-174, 1971, 32 p, 110 ref.

Descriptors: *Maine, *Coasts, *Pollution abatement, *Public rights, Water pollution, Water pollution sources, Coastal marshes, Water pollution control, Industrial wastes, Water policy, Water resources development, Water quality control, Estuarine environment, State governments, State jurisdiction, Administrative agencies, Judicial decisions, Adjudication procedure, Interstate, Eminent domain, Compensation, Government finance, Legislation, Social aspects, Legal aspects.

The recently increased interest in ecological preservation has been thwarted in part by the fact that the laws of nuisance and various constitutional guarantees serve to protect the local landowner accused of marine pollution. The various constitutional attacks on coastal anti-pollution legislation are examined to determine possible bases for defending state pollution abatement actions. The unlawful taking attack focuses on the claim that denials of the right to use land to its highest commercial advantage amounts to a taking without compensation. State economics may preclude compensation for all such takings. Various statutes are examined and solutions are offered to resolve this problem for the benefit of the state. The burden of proof dilemma lies in the fact that, although past burdens have been borne by the person attacking a polluter, state courts now must shift those burdens or the state will lose its coastal environment. Various methods of accomplishing this shift are suggested. A further obstacle to the exercise of state power, the interstate commerce dilemma, is also examined with regard to out-of-state polluters. (Smiljanich-Florida)

WATER POLLUTION CONTROL UNDER THE REFUSE ACT OF 1899,
Bill Leaphart.
Montana Law Review, Vol 32, No 1, p 120-129, 1971. 10 p, 61 ref.

Descriptors: *Rivers and Harbors Act, *Pollution abatement, *Waste disposal, *Navigable waters, Water pollution, Water pollution control, Remedies, Legislation, Administrative agencies, Administrative decisions, Navigation, Wastes, Navigable rivers, Flotsam, Waste dumps, Adoption of practices, Regulation, Waste water (Pollution), Environmental effects, Federal government, Legal aspects.
Identifiers: *Refuse Act of 1899.

An extensive study is made of the Federal Refuse Act of 1899 in order to ascertain its present viability as a method of water pollution abatement. Although the Act has seldom been enforced, it can be of considerable strategic value in pollution abatement. The dumping of refuse in navigable waters is prohibited, as is the depositing on the banks of navigable water of refuse which impedes navigation. Penalties for violations are provided, along with a provision encouraging informers, who may split the fine imposed. The definitions of 'refuse' and 'navigability' are examined to indicate the liberal definitions presently attaching to the terms. The policies of the Corps of Engineers and the Justice Department have, however, tended to emasculate the power of the Act. Under present regulations, the agencies will only prosecute where navigation has been impaired and where there has been willful violation. These restrictions are unnecessary for many provisions of the Act. Despite the refusal of these agencies to prosecute violators, a solution is suggested whereby informers may bring a common law cause of action, qui tam, which allows those who will share in a fine to bring an action enforcing the violation. LIABILITY FOR OIL POLLUTION CLEANUP AND THE WATER QUALITY IMPROVEMENT ACT OF 1970,
Douglas Meiklejohn.
Cornell Law Review, Vol 55, p 973-991, 1970, 19 p, 138 ref.

Descriptors: *Water pollution, *Oil, *Water pollution control, *Damages, Legislation, Water pollution sources, Ships, Oil industry, Oil fields, Federal government, Pollution abatement, Legal aspects, Insurance, Cleaning, Oily water, Remedies.
Identifiers: *Water Quality Improvement Act of 1970.

The Water Quality Improvement Act, a response to recent oil spills, is a major improvement over existing law, but its provisions should be extended. The Act's predecessors were inadequate, primarily because liability for pollution was limited to instances of gross negligence or willful discharge. Conversely, the Act prohibits oil discharges into United States waters, punishes violation by a civil penalty, requires reporting of violations, and authorizes the President to initiate clean-up. Although previous legislation limited pollution liability to the value of the vessel and its freight, the Act's limits are the lesser of $100 per gross ton of the vessel or $14 million. Unlike the Outer Continental Shelf Lands Act, the Water Quality Improvement Act applies to onshore and offshore facilities and imposes liability for clean-up as well as penalties for violation. Nevertheless, the Act's liability limits are too low, and the liability of the owner may be insufficient to cover clean-up costs of even the Torrey Canyon spill, a small disaster compared to the potential pollution of a supertanker. Although the owner-operator should be liable for pollution as a risk of business, when pollution results from failure to enforce regulations government should be partly liable. Cargo owners' liability for oil pollution should also be considered. (Hart-Florida)

THERMAL ELECTRIC POWER AND WATER POLLUTION: A SITING APPROACH,
Billy D. McDaniel.
Indiana Law Journal, Vol 46, No 1, p 61-112, 1970. 52 p, 190 ref.

Descriptors: *Thermal pollution, *Thermal powerplants, *Ecology, *Legal aspects, Sites, Electric power industry, Hydroelectric plants, Legislation, Water quality, Water Quality Act, Administrative agencies, Federal government, State governments, Water quality control, Water pollution control, Pollution abatement, Fishkill, Water pollution sources, Water pollution effects, Washington.

Temperature is a critical factor in aquatic life; thus industries utilizing water as a coolant have a severe impact upon ecology. Abnormal temperature may kill a species of aquatic life outright, or destroy a link in its food chain, resulting in starvation. Destructive thermal pollution may be minimized by judicious site selection, construction, and operation of a thermal electric power plant. Those contesting siting, construction, or operation may sue on traditional water law grounds or on a nuisance theory. However, the burden of proof is an effective deterrent to relief. More effective relief might be attained through imposition of water quality standards established pursuant to the Federal Water Pollution Control Act and the Water Quality Act. Weaknesses in the Federal Water Pollution Control Act concerning thermal pollution have been remedied somewhat by passage of the 1970 Water Quality Improvement Act, which specifically regulates thermal discharge. Another statutory solution has emerged with passage in the state of Washington of a law regulating site selection for thermal-electric plants by creating a site selection evaluation agency. However, truly effective regulation of thermal discharge should only come with federal administrative reform and creation of a Federal Public Utilities Agency. (Hart-Florida)

VALUATION OF FLOW AUGMENTATION RELEASES,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
Buford J. Carter, Jr., James P. Heaney, and Edwin E. Pyatt.
Journal of the Sanitary Engineering Division, ASCE, Vol 97, No SA 3, Proc Paper 8203, p 345-359, June 1971. 15 p, 5 fig, 1 tab, 10 ref, 2 append.

Descriptors: *Flow augmentation, *Waste water treatment, *Water pollution sources, *Water quality control, Rivers, Dams, Mathematical programming, Optimization.
Identifiers: Economic analysis, Regional planning.

A mathematical programming technique was used to derive an estimate of the value, measured in terms of waste water treatment costs avoided, of flow augmentation releases in a river with multiple waste sources. The overall methodology developed for quantifying flow augmentation benefits consisted of 2 main components: a simulation model and an optimization model. The purpose of the simulation model was twofold. First, it provided a technique for selecting the critical period (e.g., the one-in-10-yr 7-day low flow). Secondly, given the regional waste water treatment plant configuration specified by the separable convex programming model, it estimated the quantity of additional flow that would be needed in all other time periods of the planning horizon. The effect of additional flow in the activity coefficients in the optimization model was evaluated directly by examining limiting conditions on the quantity of available additional flow. Analyses were performed for a single source of augmented flow in the headwater reaches. The

ffect of the quality of the augmented flow on its conomic value was quantified. Included was a rocedure for incorporating the dependence of the eaeration coefficients and travel time on the river ischarge. (Veverka-Cornell)

Descriptors: *Aquatic plants, *Systematics, *Aquatic weeds, Floating plants, Rooted aquatic plants, Plant morphology.
Identifiers: *Smartweeds, *Polygonum, Polygonum meisnerianum.

The taxonomic key of identifiable aquatic smartweeds, Polygonum sp, is supplemented by a review of the merits and shortcomings of different members of the genus in water management. The second part of the bulletin reports the results of submergence trials conducted in temperature-programmed environmental chambers. The amphibious responses of Polygonum populations were appraised on the basis of mortality of shoots and leaves, and morphology and anatomy of plants. P amphibium, var stipulaceum, and P densiflorum showed the greatest amphibious response. A study of the plagiotrophy or prostrateness of P amphibium varieties indicated that this property is partially genetically controlled and partly a function of the light-inhibited negative geotropism. UTILIZATION OF HERBIVOROUS FISH IN FISH MANAGEMENT AND MELIORATION OF WATER BASINS, (IN RUSSIAN).

Vestnik Akademii nauk SSSR No 11, p 26-30, 1970.

Descriptors: *Water quality control, *Algae control, *Forage fish, Biocontrol, Remedies, Foods, Fish, Herbivores, Fish management.
Identifiers: USSR.

An address by G B Nikolski is reviewed which was delivered at the meeting of the Presidium of the USSR Academy of Science. At this time, the catch of ocean inhabiting fish is inadequate to meet human population demands and an artificial culture of herbivorous fish can provide an inexpensive source of proteins. In addition to increasing the food supply, such culture will help to eradicate the detrimental growths of algae in irrigation and drainage systems and reservoirs of hydro-electric stations. Herbivorous fish of desirable properties are absent in both Europe and central Asia, but waters of far-eastern Siberia harbor three herbivorous (common and mottled thickheads and white amur), attaining weights over 20 and even 30 kg. The two varieties are not competitors as they derive their sustenance from either near-bottom or surface phytoplankton. The presidium approved a broad program of investigation of herbivorous fish in Asia, Africa, and South America, and a systematic acclimatization of suitable stock in different parts of the USSR. WATER RESOURCES MODELING BY QUASILINEARIZATION AND INVARIANT IMBEDDING,
Kansas State Univ., Manhattan.
Irving Keao Hwang.
M.S. Thesis, Department of Industrial Engineering, 1970. 153 p, 22 fig, 13 tab, 46 ref, 2 append. OWRR Project B-015-KAN (10).

Descriptors: *Water quality control, *Water pollution control, Dynamic programming, Least squares method, Optimization, Systems analysis.
Identifiers: *Quasilinearization, *Invariant imbedding.

Two techniques were used to obtain numerical solutions to water resources problems of the boundary-value type: quasilinearization and invariant imbedding. The quasilinearization technique (Newton-Raphson method), represented an iterative approach combined with linear approximations; while the invariant imbedding approach (invariant principle), reformulated the original boundary-value problem into a family of initial value problems by introducing new variables or parameters. Using quasilinearization it was shown that with very approximate initial guesses for the unknown parameters, only 3 to 7 iterations were needed to obtain a four or five digit accuracy. Its rapid convergence property was a powerful technique for dynamic modeling of stream quality problems. The invariant imbedding approach was useful in obtaining a sequential estimation scheme in which only current data were needed to estimate the current or future values of the parameters. A least squares criterion was used to obtain the optimal and also the state or the future concentrations of the pollutants were estimated by this effective approach. Has 46 references. DYNAMIC MODELING OF STREAM QUALITY BY INVARIANT IMBEDDING,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. Stanley Lee, and Irving K. Hwang.
Kansas Water Resources Research Institute, Contribution No 47. 16 p, 11 fig, 7 ref. OWRR Project B-015-KAN (6).

Descriptors: *Dynamic programming, *Water pollution, Digital computers, Forecasting, Least squares method, Estimating, Mathematical models.
Identifiers: *Invariant imbedding.

With a digital computer, the estimator equations obtained using invariant imbedding were used to estimate the parameters in river or stream pollution. By using these equations, the parameters were estimated directly from differential equations representing the pollution model and from measured noisy data such as BOD and DO. Another advantage of this approach was that a sequential estimation scheme was obtained. By using this sequential scheme, only current data were needed to estimate current or future values of the unknown parameters. A large amount of computer time and computer memory was saved. Not only the parameters but also the concentrations of pollutants were estimated. An effective forecasting technique was formed. The classical least squares criterion was used in the estimation. NO-TILL CROPPING REDUCES POLLUTION,
Dixon Springs Agriculture Center, Simpson, Ill Dept. of Agronomy.
L. E. Gard.
Compost Science, Vol. 12, No. 2, p. 3-5, March-April 1971.

Descriptors: *Farm management, *Crop production, *Silts, *Water pollution sources.
Identifiers: Grantsburg silt loam.

The author describes the advantages of no-till cropping for grain crops as a possible solution to pollution problems. No-till cropping reduces soil runoff and the harmful pollutants found in the runoff. The author explains that since labor costs, land prices and marketing costs have increasingly brought larger acreages under one man's management, this type of cropping system provides benefits to the farmer in these areas as well. Water pollution is prevalent in the Soviet Union as in any other populous, industrial country. The author reviews the major pollution problems in the U.S.S.R. and briefly describes what has been done to correct the problems. He discusses the problems that the Soviet Union has encountered with enforcing water pollution regulations and how a system of fines has thus far been ineffective. The author explains that little can be improved without the 'necessary monetary and enforcement measures.' (Holmes-Rutgers)

Acid mine drainage includes all types of mine drainage associated with coal mining. This source of pollution of streams is now actively being attacked, primarily with simple chemical treatment processes. These leave behind troublesome problems of sludge disposal and hardened water. The principal sources of untreated acid mine drainage are abandoned deep mines and improperly reclaimed surface mines. This study recommends large capital outlays by private and public bodies to control and treat such discharges. These pollutants are formed when air and water combine with the mineral pyrite and unknown bacteria. Solutions are aimed at either preventing formation of or removing these pollutants by chemical treatment prior to release into streams. Mine sealing seeks to exclude air and water from the mine. As yet this has been unsuccessful. Drainage control seeks to minimize contact time between water and pyrite by removing the water through elaborate pumping procedures. Chemical treatment has been most effective. Both acidic and alkaline mine drainage water are aerated in large lagoons, but this creates a problem of sludge disposal and build-up of salts in equipment. Research in this area is directed by the Water Quality Office of the Environmental Protection Agency. (Rees-Florida)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

SIMULATION OF WATER RESOURCE REGIMES,
Maryland Univ., College Park. Dept. of Chemical Engineering.
T. W. Cadman, and F. J. Munno.
Water Resources Research Center, University of Maryland, Apr 1971. 46 p, 9 ref, 4 append. OWRR Project A-001-MD (1).

Descriptors: *Analog computers, *Water resources, *Simulation analysis, Reservoirs, Mathematical models, Water levels, Operations.

The objective of this project was to establish a working knowledge of the principles of analog simulation as they may be applied to water resources systems. Emphasis was directed to the use of the EAI TR-48 analog computer purchased for the project. The principles of operation of the required analog components, the derivation of the mathematical description, the techniques of analog simulation to be employed, and the demonstration of the simulation on the TR-48 were presented by use of four examples, described in detail in the Appendices. The general features of the modern electronic analog computer were discussed in the first example. A simplified water reservoir system was considered in the next example and utilized many of these general features. In a third example, the

difficult step of going from the physical situation to a mathematical model was illustrated first. Then the preliminary simulation procedures of developing a preliminary analog circuit, amplitude scaling the circuit and time scaling were presented. A trial and error problem was formulated. Finally the transient and spatial water level in the soil surrounding a reservoir was examined. The electronic analog computer proved to be a most useful tool in the simulation of water resources systems. (Kriss-Cornell)

ECONOMIC-ECOLOGIC ANALYSIS IN THE CHARLESTOWN METROPOLITAN REGION: AN INPUT OUTPUT STUDY,
Clemson Univ., S.C. Dept. of Agricultural Economics and Rural Sociology.
Eugene A. Laurent, and James C. Hite.
WRRI Report No 19, Water Resources Research Institute, Clemson University, Clemson, South Carolina, Apr 1971. 102 p, 2 fig, 12 tab, 31 ref, 2 append. OWRR Project B-012-SC (3).

Descriptors: *Input-Output analysis, *Model studies, Economic impact, Ecology, Natural resources, Cost analysis, South Carolina.
Identifiers: Charlestown (SC).

A model based on input-output analysis was developed to incorporate environmental as well as pecuniary values into management systems for natural resources. An environmental matrix showing the inflow from the environment and outflow to the environment associated with one dollar of gross sales by various economic activities was developed to fit within the system. The linking of the economic model to the environmental matrix completed the model. The linkage operation involved post-multiplying the environmental matrix by the inverse matrix of the input-output model to form an economic-ecologic matrix. The completed 31-sector economic input-output model was used to quantify economic-ecologic linkages in the Charlestown, South Carolina, study area. Resource or environmental-income multipliers were generated to indicate the direct and indirect impacts, both on the economic and ecologic systems of various types of economic growth as well as alternative management strategies. The model not only provided a planner with information on which sectors were likely to decrease the environmental quality of a region, but also which particular pollutants were likely to be responsible. (Veverka-Cornell)

A NEW TECHNIQUE FOR RELIABILITY CALCULATIONS,
Stagg Systems, Inc., New York.
W. R. Christiaanse.
Institution of Electrical and Electronic Engineers Translations Power Applications Systems, Vol PAS-89, No 8, p 1836-1847, Nov/Dec, 1970. 12 p, 15 fig, 1 tab, 12 ref, 5 disc.

Descriptors: *Reliability, *Mathematical analysis, Computer programs, Mathematical models, Interconnected systems, *Transmission (Electrical), *Analytical techniques, Matrix algebra, Electric power failure, Storms, Maintenance, Probability, Networks, Simulation, Calculations, Overloads, Performance.
Identifiers: Outages, Maintenance schedules.

A new technique for calculating the rate and duration of service interruptions in transmission and distribution systems is presented. The technique can be applied easily to large networks, networks with multiple sources, and networks of any configuration, not necessarily series-parallel subsystems. The approach is based on the traditional exponential probability density functions for time to failure and repair time, but incorporates a new mathematical concept. Results include the expected outage rate and outage duration for each bus, and a summary of the causes of outages at each bus. The derivation of equations and the solution of a sample problem using a pilot computer program are included. In the present form, the technique does not include methods for representing dependent failures of nonparallel lines caused by overloads or tower failures. Provision is made for the effects of maintenance outages. The technique represents a useful planning tool in spite of the limitations. (USBR)

OPTIMIZATION OF DISCRETE OPERATIONS RESEARCH MODELS BY DIFFERENTIAL SENSITIVITY ANALYSIS,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
S. Waziruddin, and E. Stanley Lee.
Kansas Water Resources Research Institute, Contribution No 51, (undated). 18 p, 9 ref, 1 tab. OWRR Project B-015-KAN (9).

Descriptors: *Operations research, *Dynamic programming, Optimization, Mathematical models, Model studies, Management.

Multistage operations research problems when formulated for solution by the discrete principle usually resulted in a set of nonlinear differential equations of the boundary value type. Due to the nonlinearity of the system and also due to the complexity of operations research problems, standard methods for solving linear two-point boundary value problems in difference equations could not be applied easily. An algorithm based on differential sensitivity analysis was presented for solving the above problem. The method was essentially based on an algorithm due to Padmanabhan and Bankoff (Chem Eng. Science, Vol 25, p 833, 1970) who proposed a method for overcoming the boundary value difficulty in continuous systems. The method was computationally simple and possessed good stability characteristics with a fast convergence rate. An added advantage was that the method in its present form did not handle easily state variable inequality constraints. Problems from the field of production and advertisement scheduling were solved for purposes of illustration. (Veverka-Cornell)
W71-09215

OPTIMIZATION OF DYNAMIC OPERATIONS RESEARCH MODELS BY A FUNCTIONAL GRADIENT TECHNIQUE,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
S. Waziruddin, and E. Stanley Lee.
Kansas State University Bulletin, Special Report No 93, Kansas Water Resources Research Institute, Contribution No 48, Jan 1971. 20 p, 11 fig, 1 tab, 9 ref. OWRR Project No B-015-KAN (7).

Descriptors: *Dimensional analysis, *Dynamic programming, Optimization, Mathematical models, Modd studies, Management.
Identifiers: *Functional gradient technique, Quasilinearization technique.

A functional gradient technique was used to solve production planning problems with end constraints, inventory control, and advertising scheduleing problems and was shown to be effective for solving multi-dimensional dynamic optimization problems. A seven dimensional production problem was solved as an illustration of the effectiveness of this technique. As seen from the numerical examples, the functional gradient technique was capable of solving fairly large dimensional problems with or without end constraints. Due to the first order convergence properties, this technique is fairly stable even with initial approximations far removed from the true optimum. The main disadvantage of this technique was the slow rate of convergence near the optimum. It is recommended that the functional gradient technique be used to obtain a control trajectory close to the optimum; then switch to methods that have quadratic convergence properties such as quasilinearization or the second variational techniques to obtain the true optimum, thus assuring numerical stability and faster convergence rate. Advantages and disadvantages of the gradient techniques are discussed in detail. (Veverka-Cornell)

INVARIANT IMBEDDING, ITERATIVE LINEARIZATION, AND MULTISTAGE COUNTERCURRENT PROCESSES III. ESTIMATION AND THE OVER-DETERMINED SYSTEM,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
J. C. Noh, and E. S. Lee.
Presented at AIChE 67th National Meeting, Atlanta, Georgia, Feb 15-19, 1970. Typescript, undated 34 p, 2 fig, 6 tab, 5 ref. OWRR Project B-015-KAN (8).

Descriptors: *Estimating, *Least squares method, Distillation, Dynamic programming.
Identifiers: *Quasilinearization *Invariant imbedding.

The usefulness of the quasilinearization technique as applied to certain design problems where the reflux ratio is the unknown variable, was demonstrated. The problem was first formulated as a nonlinear two-point boundary value problem in difference equations. This boundary value problem was then solved by the quasilinearization technique. The main advantage of this technique was its quadratic convergence rate. Only 4 or 5 iterations were needed to obtain a 4 to 5 digit accuracy. As shown by numerical examples, convergence was obtained even if very approximate initial approximations or initially guessed values for the unknown functions were used. As an illustration, a simple binary distillation problem was first considered. Multicomponent distillation was then considered. It was shown that the multicomponent distillation problem could be formulated either as a boundary value problem or as an estimation problem depending on the number of terminal concentrations specified. This procedure completely eliminated a trial-and-error difficulty and treated over-determined systems in a straightforward manner by use of least squares criterion and minimization. (Veverka-Cornell)

DYNAMIC PROGRAMMING QUASILINEARIZATION AND THE DIMENSIONALITY DIFFICULTY,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. Stanley Lee.
Journal of Mathematical Analysis and Applications, Vol 27, No 2, p 303-322, Aug 1969. 20 p, 7 ref. OWRR Project No B-015-KAN (4).

Descriptors: *Dynamic programming, *Dimensional analysis, Computer programs, Mathematical models.
Identifiers: *Quasilinearization technique.

With the linearization of nonlinear equations by the quasilinearization technique, a combined linearization and iteration scheme was obtained. By the use of this scheme, the dimensionality of the functional equation of dynamic programming was reduced to

nc in most cases. The advantage of this technique as that both the computer memory requirement nd computation time were reduced considerably. he usefulness of this method depended heavily pon the rate of convergence of the quasilineariza- on technique, which was shown to be quadrati- lly convergent in various numerical experiments there was any convergence. Furthermor, conver- nce was obtained even with very approximate in- ial approximations for a large number of roblems. The recursive functional equations of ynamic programming only needed to be solved 3 7 times, and the number of iterations required as generally independent of the number of the ate variables. As was seen from the numerical ex- mples, the scheme for overcoming the linearity fficulty did not slow down the convergence rate ppreciably. The main disadvantage of this ap- roach was that the transformation or state varia- e equations must be differential. (Veverka-Cor- ll)

ERATIVE TECHNIQUES IN OPTIMIZATION,
ansas State Univ., Manhattan.
Stanley Lee.
ChE Journal, Vol 14, No 6, p 908-916, Nov 68. 9 p, 2 fig, 18 ref. OWRR Project No B-015- AN (3).

escriptors: Dynamic programming, Optimization, athematical models.
entifiers: *Quasilinearization.

e quasilinearization technique, which is essen- lly an iterative approximation scheme combined th linearization, was used to overcome the mensionality difficulties of dynamic pro- amming, especially for discrete systems which re ideally suited for obtaining dynamic pro- amming solutions. The approach was based on e fact that if the difference of differential equa- ns are linear, their closed forms of solutions can obtained. This solution permitted the separation effects due to the initial state from the effects e to the control variables. By using this separa- n combined with quasilinearization, the dimen- nality of the functional equation of dynamic pro- amming was reduced to one in most cases. First, e optimization problem in cross-current extrac- n with discontinuous objection functions was ed to illustrate the technique. Then the technique s generalized to systems of difference and dif- ential equations with fairly general objective nctions. The main disadvantage of the present proach was that the transformation or state vari- le equations must be differential. Furthermore, order to obtain the quadratic convergence pro- rty, the partial derivatives in the Taylor series ex- nsion must be obtained accurately. (Veverka- rnell)

TOMATIC PLANNING OF THE LEAST- ST WATER DISTRIBUTION NETWORK,
hal Consulting Engineers, Ltd., Tel-Aviv rael). Long Range Planning Sect.
sha Kally.
ter and Water Engineering, Vol 75, No 902, p 8-152, Apr 1971. 5 p, 5 fig, 2 ref.

scriptors: *Economic efficiency, *Water-dis- ution (Applied), Linear programming, Op- ization, Costs, Planning, Hydraulics.
ntifiers: Hardy Cross method.

th the advent of electronic computers, the nning of water distribution networks was radi- ly changed by being made an automatic com- er operation and by producing the most nomic as well as the most effective solution to planner's problem. To illustrate this planning thod the use of an electronic computer was ded and was based on a combination of 2 hniques: (1) the computation of the hydraulic a of the network by the Hardy Cross method; l (2) finding the optimum solution for a water supply network with the aid of Linear Programming. The results were the following: (1) The special computer program--the 'Network Optimiser'--produced cheaply and rapidly the best cost plan of both looped and tree-like networks; (2) In the case of a tree-like network, the Optimiser selected the optimal (i.e. the least cost) pipe alignment (out of a set of given possibilities) and also determined the optimal combination of diameters; (3) In a looped network, where the routes were fixed, and none of them was to be eliminated, the Optimiser indicated the best selection of pipeline diameters; and (4) When some or all of the network inflows were boosted by a pump, the optimal pumping head was also determined by the Optimiser, so that the whole set of pipeline diameters plus inflow heads was an optimal one. COMPUTERISED OPERATION OF DISTRIBUTION SYSTEMS,
City Water Board, San Antonio, Tex.
Robert P. Van Dyke.
British Water Supply, No 1, p 15-23, Jan 1971. 9 p, 6 fig.

Descriptors: *Distribution systems, Computer programs, Data collections, Control systems, Texas, Water supply.
Identifiers: *San Antonio (Tex).

General applications of supervisory control and computerized operation as well as those of the specific water system used by the City Water Board in San Antonio, Texas were discussed. To expand the water works system to meet the population explosion in San Antonio a computer system was established to enable the City Water Board to have a precise method of data acquisition and control, and to provide the operator of the control center with extremely accurate, dependable, and continuously updated information. The system was capable of expansion to handle a water distribution workload double the size of the one at the present time and additionally provide information and control for 3 more control heating and cooling plants. This system was designed for the most efficient and economical operation of the 2 plants, both for the present and for the years to come. (Veverka-Cornell)

LINEAR PROGRAMING MODELS FOR ESTIMATING THE AGRICULTURAL DEMAND FUNCTION FOR IMPORTED WATER IN THE PECOS RIVER BASIN,
New Mexico Univ., Albuquerque.
Micha Gisser.
Water Resources Research, Vol. 6, No. 4, p. 1025-1032, Aug. 1970, 4 tables, 1 figure, 13 references.

Descriptors: *Water allocation (Policy), *Water demand, *Crop production, *Linear programming.
Identifiers: *Pecos River Basin, Miller's theorem.

This paper provides the results of applying parametric linear programing methods to estimate the agricultural demand function for imported water in the Pecos Basin. A parametric linear programing model suitable for the Pecos Basin is developed. Agricultural activities in which land is irrigated either by local or imported water and either ditch or sprinkler irrigation are developed and adjusted for forecasted 1980 prices. These agricultural activities are used by the parametric linear programing model, and various agricultural demand functions are obtained for the Pecos Basin. These functions show the expected quantities of imported irrigation water that would be demanded at different prices and under a variety of constraints. (Author's abstract)

6B. Evaluation Process

ESTIMATION DEVIATIONS: THEIR EFFECT UPON THE BENEFIT-COST RATIO,
Oklahoma Univ., Norman; and Iowa State Univ., Ames.
R. P. Lutz, and H. A. Cowles.
Engineering Economics, Vol 16, No 1, p 21-42, Oct-Nov 1970. 22 p, 4 fig, 1 tab, 7 ref, append.

Descriptors: *Benefit-cost analysis, *Benefit-cost ratios, Contingency costs, Cost analysis, Estimated benefits, Estimated costs, Construction costs, *Economic feasibility, *Errors, Investment, Analysis, Irrigation systems, Indexes (Ratios), Mathematical models, Frequency distribution, Probability, Decision making.
Identifiers: *Bureau of Reclamation, Density ratio.

Government expenditures have been expanding at a rapid rate in the U S, with no indication that this trend will be curtailed. The very nature of projects developed by these expenditures lends uncertainty to the estimates of costs and benefits that make up the benefit-cost ratio used for project justification. A technique for recognizing uncertainty and bias in estimates of benefits and costs and for compensating for their effects on the benefit-cost ratio is presented. Using the technique to analyze 48 projects of the Bureau of Reclamation, the authors found that for all projects, deviations of the realized benefit-cost ratios from those estimated indicated 44.2% less return to the nation's economy than was anticipated. With variation of this magnitude, the decision-maker should be provided information about the likelihood and extent of deviations from cost and benefit estimates to adequately ration capital among competing demands. Identifiers: *Secondary benefit analysis.

The evaluation of waterways development projects, and ultimately the selection of a project for action, is usually based upon anticipated benefits that accrue as a result of the development. The identification and assignment of dollar values to secondary benefits is, at best, extremely difficult and vague. The interrelationships among both primary and secondary benefits are not well known. Available data on secondary benefits are scarce as are mathematical models that permit examination of the effect of such benefits on the project selection decision. This report includes a review of current and recently completed research in the area of secondary benefits related to waterways development, evaluation of the results of related and appropriate research, identification of promising areas of research, and an annotated bibliography of appropriate reference sources. The most critical is to develop data systems for watersheds. After an organized data base is available, studies of the relationships of all pertinent factors within a watershed should be made. Identifiers: *Comprehensive planning, *Commission organization, Framework, Assumptions, Objectives, Policy decision, Criteria, Guideline, Single-purpose planning.

This article dealt with the many problems that arise in connection with the planning, development, control, and use of water and land resources in the Southeast River Basins. Commission organization policy decisions, objectives and guidelines, economic framework, assumptions, and criteria were discussed. In projection formulation, both tangible and intangible effects were considered. Cost and benefits were presented in monetary terms to the extent practicable and, beyond that, the effects were discussed in narrative terms. Projects and programs were specifically formulated to serve all of the conventional purposes plus recreation and pollution abatement. Costs were allocated to all purposes, using standard allocation procedures. The plan was designed to meet projected needs as determined by the use of an economic model. The proposed developments individually and collectively, will produce benefits in excess of costs. The major part of the cost will be borne by nonfederal interests. (Wang-Rutgers)

The values a society holds regarding effective development of water resources must be considered in the decision making process. Cettain peoples have certain needs and necessities and each relates to a benefit-cost relationship differently. Our value system tells us what is desired. Three test areas, Pacific Northwest, Arizona, and the Kalahari desert in Africa show interesting differences that are significant in the cultural values for water resource differences. A model of the Susquehanna River basin relates the region's economy to its water resources. It is comprised of three interrelated sectors: (1) demographic, (2)employment, and (3) water. The river basin is divided into nine subregions for purposes o economic analysis and the water sector examines certain critical points within each subregion. Each sector of the model is developed for a subregion that interacts with the others. The use of the model is for projecting future economic growth and the impact on water resource development. PRELIMINARY EVALUATION OF THE HYDROLOGIC EFFECTS OF IMPLEMENTING WATER AND SEWERAGE PLANS, DADE COUNTY, FLORIDA,
Geological Survey, Miami, Fla.
F. W. Meyer.
Geological Survey Open-file Report 71003, 1971 110 p, 19 fig, 17 tab, 51 ref.

Descriptors: *Water supply, *Urbanization *Sewage disposal, *Florida, *Water resource development, Municipal water, Water balance Planning, Aquifers, Water utilization, Hydrogeology, Land use, Consumptive use, Water demand.
Identifiers: *Dade County (Fla), *Miami (Fla).

As urbanization continues in Dade County Florida, water requirements will increase. I present trends continue, by the year 2020 the tota demand for water supplies in Dade County wi average 760 mgd. About 12 mgd will be pumped t the Florida Keys. By year 2020, 540 mgd of wast water will be discharged from sewers to the ocean With increasing runoff and sewage discharged t the ocean, the total consumptive use of water wi ultimately exceed the region's developed wate supply capability. By 1976, available fresh wate may be insufficient to satisfy all competing de mands, according to recent projections by the U. S Corps of Engineers (1968), unless plans for in creasing the efficiency of water use are effected Plans include reduction in storm runoff by large scale backpumping to Lake Okeechobee and th conservation areas. Other alternatives includ separation of storm and sanitary drainage system and the prevention of fresh water leakage into th sanitary sewer system. (Knapp-USGS)

iew rules proposed by the Interior Department ertaining to grants for construction of treatment vorks are intended to provide greater assurance hat the quality of treated water will be improved. The following requirements are proposed to chieve that objective: (1) treatment works must e included in a basin-wide, metropolitan, or re-ional pollution abatement plan; (2) operation nust conform to requirements for industrial waste reatment; and (3) efficiency, economy, and effec-veness will be achieved by design and periodic in-pection. Information which may be required by ne Commissioner includes: (1) sources of pollu-on; (2) volume of discharge; (3) character of ef-uent; (4) present treatment; (5) water quality ef-ect; and (6) detailed abatement program. No grant ill be made under the new rules if the project is in-nded to treat industrial waste, rather than the astes of the entire community or region con-erned. Where industrial wastes are treated by the roject, an equitable system of cost recovery must e effected. All projects must be inspected an-ually during the first three years and periodically ereafter. (Hart-Florida)

OLLECTION OF STEAM-ELECTRIC ENERATING PLANT POLLUTION CONTROL ATA.

deral Register, Vol 35, No 29, p 2832-2833 (Feb 70). 2 p.

Descriptors: *Water pollution control, *Air pollution, *Pollution abatement, *Federal government, Thermal pollution, Federal Power Act, Electric power, Administrative agencies, Water pollution.

The Federal Power Commission publishes notice of proposed rule making. The proposal would require submission of information designed to provide a basis for the development of effective environmental quality programs in coordination with the National Air Pollution Control Administration and the Federal Water Pollution Control Administration. The information form proposed is designed to obtain information as to the fuel quality used in fossil-fueled steam electric generating plants of 25 or more megawatts and other data relating to atmospheric emissions and thermal pollution. Although the form was originally formulated for distribution only to selected utilities, it is now contemplated for reports from all steam-electric plants. The new form reflects the increased federal concern for preservation of air and water resources. The report is to be submitted every fifth year. Comments by interested persons must be forwarded to the Federal Power Commission by March 2, 1970. (Hart-Florida)

INDUSTRIAL POLLUTION CONTROL,
Fred A. Clarenback.
112 Cong Rec 11719-11721 (1966). 3 p.

Descriptors: *Water pollution control, *Pollution abatement, *Industries, *Administration, Water pollution, Water pollution treatment, Industrial wastes, Effluents, Cities, Administrative agencies, Water pollution sources, Non-structural alternatives, Pollutants, Water quality control.
Identifiers: *Effluent charges.

In 1966, a senator advocating a system of economic incentives to encourage industries to abate pollution placed a paper into the Congressional Record concerning the hidden costs of industrial pollution and the use of effluent charges to encourage industry to abate pollution. The paper is entitled 'Incentives for Industrial Pollution Control'. The author postulates first that single companies find the cost-benefit ratio of pollution control unsatisfactory, because the benefits to downstream riparians are not included in the calculations. However, the overall cost to the public of failure to begin pollution abatement is found to be much higher than the cost to the single industry. It is observed that forestalling assertion of public authority for pollution is an incentive for voluntary pollution abatement, but voluntary abatement has been unsuccessful. The author advocates establishing 'pollution quotas' among cities and industries, enforceable by effluent charges, to achieve an acceptable standard of stream water quality. The charges would vary inversely with the relationship of pollution to the quality standard. The advantages of the effluent-charge system are stated to be: (1) free choice by industry; (2) inducement to develop low cost pollution control measures; and (3) flexibility. (Hart-Florida)

REGULATION OF PUBLIC USE OF RESERVOIR AREAS.
Corps of Engineers, Washington, D.C.

Code of Federal Regulations, Title 36, Chap III, Part 311 (1970). 7 p.

Descriptors: *Reservoirs, *Public rights, *Regulation, *Administrative agencies, Administration, Water resources development, Recreation, Boating, Swimming, Hunting, Fishing, Environmental sanitation, Public health, Water pollution, Sewage, Wastes, Federal government, State governments, Permits, Navigable waters, Access routes, Boats, Boating regulations, Water supply.

These regulations issured by the Department of the Army govern public use of certain reservoir areas with respect to such matters as : (1) various boating activities, (2) swimming, (3) hunting, (4) fishing, (5) camping, (6) access to water areas, (7) pollution of waters, (8) sanitation, and (9) recreational activities. The regulations first list the states and projects within the states to which they are applicable. Commercial boating is prohibited except as specifically authorized by the Department of the Army. Private boating on reservoirs for fishing and recreational use is permitted except where prohibited by the District Engineer. Various sections cover such things as safety of boats and types of boats permitted on reservoir waters. All boats must be securely moored when not in use. No vessel shall discharge sewage, garbage, or other pollutants into the waters of a reservoir, except in accordance with state and local health agency standards permitting such discharges in deep waters. Swimming and bathing are permitted except in areas designated by the District Engineer. The regulations list the requirements for hunting and fishing and the areas where such activity may be prohibited. Rights of public access to water areas are enumerated. No refuse or wastes may be deposited in reservoir areas except at designated points or places designed for sanitary disposal. (Duss-Florida)

WHO'S RESPONSIBLE FOR POLLUTION,
James Marshall.
American Bar Ass'n Journal, Vol 57, p 21-26 (1971). 6 p.

Descriptors: *Water pollution, *Pollution abatement, *Environmental effects, *Legal aspects, Legislation, Remedies, Environment, Ecology, Air pollution, State governments, Federal government, Local governments, Technology, Navigable waters, Sewage, Natural resources, Water supply, Pesticides, Administrative agencies, Water pollution sources, Industrial wastes, Costs, Damages, Balance of nature.
Identifiers: Refuse Act, *Administrative Procedure Act, *National Environmental Policy Act.

Considering the great threat posed to our society by various types of pollution, this article concentrates its attention on the legal responsibility for pollution and the legal safeguards which exist or should be enacted in order to prevent pollution. The author first considers the interrelationship of different polluters and the cumulative effect which various types of pollution have upon our environment. Different branches of government, industry, and consumers receive attention. In the past, corporations and governments have omitted from their balance sheets the cost to the nation resulting from activities which damage our environment. There is need to enact legislation which sets deadlines for cleaning up and preventing pollution. Legal remedies through court action provide one avenue for successful pollution control. The Refuse Act of 1899 is one example of legislation which provides for redress against polluters of navigable waterways. The author considers injunctive relief the best remedy for pollution damage. Several types of cases are cited and there is a discussion of the need to expand plaintiff's rights. The article concludes with a consideration of the Administrative Procedure Act and the National Environmental Policy Act, both of which may be of service in pollution control. (Duss-Florida)

CLEAN LAKES ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT).

Senate Bill 1017, 92d Cong, 1st Sess (1971). 9 p.

Descriptors: *Water pollution control, *Lakes, *Grants, *Treatment facilities, Water pollution, Water pollution sources, Water treatment, State governments, Federal government, Administrative agencies, Water quality, Water quality control, Discharge (Water), Cities, Legal aspects, Pollutants, Pollution abatement, Financing.
Identifiers: *Clean Lakes Act.

The proposed Clean Lakes Act of 1971, a bill to amend theFederal Water Pollution Control Act, is designed to improve the quality of fresh water navigable lakes in both urban and rural areas, with special emphasis upon small community lakes. The Administrator of the Environmental Protection Agency is authorized to increase state grants for modern treatment works discharging into lakes where enforceable water quality standards have been approved by the Administrator. One-hundred fifty million dollars is appropriated for the increased grants. Additionally, technical and financial assistance may be provided for approved pollution abatement programs for lakes. Various criteria for approving applications are promulgated. Furthermore, appropriations and provisions for the Secretaries of Agriculture and the Army to furnish personnel, services, and facilities at state request are given. Discharge of waters into approved lakes in violation of established water quality standards is prohibited. Knowing violation is a criminal offense, and penalties are prescribed. Provisions for civil relief by injunction or restraining order are also given. (Hart-Florida)
W71-08992

A BILL TO AMEND THE PUBLIC HEALTH SERVICES ACT TO PROHIBIT THE DISCHARGE OF ELEMENTAL MERCURY AND ITS COMPOUNDS INTO ANY WATERS OF THE UNITED STATES WHICH DIRECTLY AFFECT THE PUBLIC HEALTH.

House Bill 130, 92d Cong, 1st Sess (1971). 3 p.

Descriptors: *Public health, *Chemical wastes, *Water pollution sources, *Discharge (Water), Inorganic compounds, Metals, Toxins, Legislation, Water pollution, Pollution abatement, Pollutants, Water pollution control, Water quality, Water quality control, United States, Administration, Administrative agencies, Legal aspects, Regulation, Federal government.

Discharge of elemental mercury or mercury compounds into any United States waters is prohibited by this proposed amendment to the Public Health Services Act. All previous licenses, permits, or authorizations for discharge of mercury compounds or mercury are terminated, and further authorization may not be granted. A fine of $10,000 may be imposed for violation of the Act, for continuing violations, each day is a separate offense. Furthermore, federal district courts are given authority to restrain violation, and failure to obey a court order is punishable as contempt. (Hart-Florida)
W71-08993

EMERGENCY WATER POLLUTION PREVENTION ACT OF 1971 (A BILL TO ESTABLISH AN IMMEDIATE PROGRAM FOR THE PREVENTION OF OCEAN POLLUTION).
Senate Bill 1286, 92d Cong, 1st Sess (1971). 4 p.

Descriptors: *Water pollution, *Oceans, *Waste disposal, *Water quality control, United States, Federal government, Legislation, Legal aspects, Water pollution control, Pollution abatement, Pollutants, Administrative agencies, Contiental shelf, Admiralty, Ships, Regulation.

Loading of vessels with any material for ocean disposal would be immediately prohibited by this proposed amendment to the Federal Water Pollution Control Act. The bill is entitled the Emergency Water Pollution Prevention Act of 1971. Further regulations would be promulgated by the Administrator of the Environmental Protection Agency to govern issuance of permits for ocean disposal only when it is not harmful to the environment and is beyond the Continental Shelf and United States waters. The civil penalty for violation of the Act is a $25,000 fine; vessels are liable in rem for the civil penalty. The terms 'master', 'owner', 'ocean waters', and 'vessel' are defined in the Act. (Hart-Florida)
W71-08994

OIL SPILL PREVENTION AND POLLUTION CONTROL.
Fla Stat Ch 376 (Supp 1970). 7 p.

Descriptors: *Florida, *Water pollution, *Oil, *Administrative agencies, Legislation, Regulation, Pollution abatement, Pollutants, Water pollution control, Water quality, Water quality control, Ships, Oily water, State governments, Damages, Adminstration.

The Oil Spill Prevention and Pollution Control Act complements federal legislation in the same area. The Act states the duties of the department of natural resources and provides definitions of crucial terms. Discharge of all petroleum products in coastal waters is prohibited. Operation of unlicensed terminal facilities is prohibited. The regulatory powers of the department of natural resources are set forth; the department is directed to promulgate certain regulations. The Act also prescribes the duties of port managers in preventing oil pollution by vessel inspection. Moreover, persons making prohibited discharges are directed to remove the prohibited materials to the department's satisfaction. Other provisions for removal of prohibited discharges are established. The department is directed to maintain sufficient personnel and equipment to implement the Act's requirements. The Florida Coastal Protection Fund is established to implement the Act. Licensees are liable to the state for costs of clean-up activities resulting from prohibited discharges. Other provisions include: (1) bonding requirements for vessels and terminal facilities, (2) derelict vessels, (3) enforcement and penalties, (4) legislative reports, (5) budget approval, (6) limitation on local ordinances, (7) limitation on application of the Act, and (8) the governor's emergency powers. (Hart-Florida)
W71-08995

HEINZ V BOROUGH OF ESSEX FELLS (CITY'S LIABILITY FOR DISCHARGING OIL INTO STREAM).
151 A 593-594 (Ct Err and App NJ 1930).

Descriptors: *New Jersey, *Water pollution, *Oil, *Cities, Water pollution effects, Water pollution sources, Water quality, Pollutants, Legal aspects, Judicial decisions, Oily water.

Plaintiff farmowner sued defendant city for damages from stream pollution. The stream was unfit for consumption by domestic animals, and the oil in the stream had ignited and burned the fence in plaintiff's pasture. Discharge from a pumping station was the primary source of the oil, but some pumping station oil was also dumped on nearby roads and could have been washed into the stream. Following a lower court verdict for plaintiff, defendant objected to a jury charge which stated that defendant had no right to discharge oil from its pumping plant into the stream or upon the roads to plaintiff's detriment. Defendant asserted the charge deprived it of the exemption of municipalities from liability for governmental functions. The New Jersey Court of Errors and Appeals held that the charge was proper and stated the general rule to be that a municipality is immune from liability for strictly governmental functions only when it is free from any active wrongdoing. (Hart-Florida)
W71-08996

AN ACT RELATING TO SANITARY SEWAGE DISPOSAL UNITS: OCEAN OUTFALL AND DISPOSAL WELL TREATMENT REQUIREMENTS.
Fla Laws ch 70-82, p 199-200 (1970). 2 p.

Descriptors: *Florida, *Water pollution control, *Treatment facilities, *Sewage disposal, Legislation, Legal aspects, Disposal, Treatment, Ultimate disposal, Municipal wastes, Supervisory control (Power), Organic wastes, Pollutants, Sewage effluents, Sewage sludge, Waste water (Pollution), Environmental sanitation, Pollution abatement, Sanitary engineering, Oceans, Administration, Administrative agencies, Administrative decisions, Adoption of practices, State jurisdiction.

No state agency, county, special district, or municipality shall approve construction of sanitary sewage ocean outfalls or disposal wells not providing for secondary treatment of wastes. Additional advanced treatment may be ordered by the Department of Air and Water Pollution. Existing outfalls and wells shall provide secondary and necessary additional advanced treatment by January 3, 1974. Failure to conform shall be punishable by a five hundred dollar fine for each twenty-four hours, or fraction therof, of continued violation. (Earl-Florida)

TAX CREDITS FOR EXPENDITURES ON POLLUTION ABATEMENT FACILITIES.
Public Act No 291, Connecticut Legislative Service, p 317-318 (1969). 2 p.

Descriptors: *Connecticut, *Taxes, *Pollution abatement, *Waste treatment, Water pollution, Water pollution control, Water quality, Water quality control, Industrial wastes, State governments, Financing, Costs, Equipment.

Five per cent of expenditures for construction, rebuilding, acquisition, or expansion of facilities for treatment of industrial waste shall be allowed as tax credits in the year of expenditure under the recently enacted Connecticut legislation. If the credit allowed exceeds the amount of pre-credit tax, the excessive amount may be carried over into the succeeding four years. (Hart-Florida)

REGULATION OF DRILLING FOR AND DISPOSAL OF SALT WATER.
Act 111, Acts of Arkansas, p 316-318 (1969). 3 p.

Descriptors: *Arkansas, *Drilling, *Saline water, *Wells, Permits, Natural gas, Oil, Regulation, Drainage, Public health, Water pollution, Administrative agencies, Legislation, Seepage, Water pollution control.

Amending the Arkansas act relating to the regulation of drilling for and disposal of salt water, the Act empowers the Arkansas Oil and Gas Commission to regulate such activities. With respect to oil and gas development it is the purpose of the Act to prevent within each developed unit such reasonably avoidable drainage as is not equalized by counter drainage. With respect to well drilling for the production and disposal of salt water, the Commission shall have jurisdiction and authority over all persons and property to the extent necessary to effectuate the purposes of the Act. Among the purposes of the Act are: (1) to require operators to obtain permits from the Commission before drilling

or salt water; (2) to regulate drilling methods so as prevent the escape of salt water out of one ratum into another, the intrusion of salt water to oil and gas strata, and the pollution of fresh ater supplies by salt water; (3) to require the aking of reports to the Commission regarding illing; and (4) to regulate other aspects of drilling order to minimize the dangers involved with re- ard to natural resources and public safety. (Duss- orida)

N ACT TO PROHIBIT THE SURFACE ISCHARGING SALTWATER ON THE SUR- ACE OF LANDS; TO PROHIBIT TAX DEDUC- ONS TO THOSE WHO DISCHARGE SALT- ATER: AND FOR OTHER PURPOSES.
ct 254, Acts of Arkansas, p 795-796 (1969). 2 p.

escriptors: *Arkansas, *Oil industry, *En- oachment, *Water pollution sources, Well regu- ions, Saline water-freshwater interfaces, epage, Wells, Mining, Oil wells, Salinity, Legisla- n, Taxes, Secondary recovery (Oil), Injection, l fields, Oil, Saline water, Groundwater, Fresh- ter, Streams, Water pollution control, Pollution atement, State governments, Legal aspects.

der this Act, tax deductions are denied oil-well erators who allow injected saltwater to escape d enter streams. The Act is applicable to in- iduals, partnerships, and corporations or em- yees who willfully or negligently cause or rmite saltwater to flow, seep, or otherwise escape m leased premises. Any individual can file a mplaint and secure a hearing before the Pollu- n Control Commission for violations of this Act. on a finding that the accused has violated this t tax deductions, under Acts 57 and 138 of 59, shall be denied for one year. Any violation ring a period of suspension shall extend the pension for one year from the last violation. ould any stream contain more than 250 parts per lionth of chlorides, the Pollution Control Com- ssion shall seek and take steps to eliminate the rce of such pollution. (Earl-Florida)

WATER LAW: BACKGROUND AND TRENDS,
Arizona Univ., Tucson.
R. E. Clark.
Paper National Meeting, American Society of Civil Engineers, Technical Sessions of the Sanitary Engineering Division, Phoenix, Ariz, Jan, 1971. 25 p, 55 ref.

Descriptors: Laws, *Legal aspects, *Legislation, Groundwater, *Water law, Water conservation, Groundwater depletion, Groundwater management, Water allocation (Policy), Administration, *Water management (Applied), Water pollution, Water quality, Water resources, Bibliographies, Water rights, Interstate compacts, Appropriation (Water rights), Agriculture.
Identifiers: Water availability, Colorado River Compact, National Water Resources Council, Central Arizona Project.

Water laws have evolved or have been refined through successive approximations, more inclusive generalizations, and verified hypotheses. The first water laws in the US emerged from common law and practices of miners, farmers, and pioneers. Most water laws have grown unevenly out of necessity, compromise, and pressure. Water laws in several states do not take into account groundwater or the interrelationship between surface and groundwater, and until a few years ago, all but ignored water quality. Today there is good reason for reexamination of the water resources policy. Problems of uneven distribution of supply and shortages, allocation, preferences, waste, quality, and monopoly require more attention. Trends toward improvement can be seen in some of the problem areas. (USBR)

LIGHTNER V CITY OF RALEIGH (DAMAGES FROM SEWAGE EMPTIED INTO CREEK ADJACENT TO PRIVATE PROPERTY).

206 NC 496, 174 SE 272-278 (1934).

Descriptors: *North Carolina, *Waste water (Pollution), *Sewage disposal, *Municipal wastes, Cities, Judicial decisions, Legal aspects, Damages, Remedies, Flood damage, Easements, Prescriptive rights, Streams, Degradation (Stream), Streamflow, Water pollution, Water pollution sources, Waste water disposal, Waste disposal, Sewage.

Plaintiff landowners sued defendant city for damages resulting from the emptying of sewage into a creek adjacent to their property. Defendant was using this creek as a sewage outlet when plaintiffs purchased the land, but many new sewage outlets into the creek were constructed after plaintiffs' acquisition of the land. During rains or floods raw sewage was deposited on plaintiffs' land. Defendant argued that it had acquired a prescriptive right to dump sewage in the creek and that plaintiffs' claim was barred by the statute of limitations. Defendant also maintained that it had an easement. The jury rendered a verdict for defendant. The Supreme Court of North Carolina affirmed, holding that a verdict on conflicting evidence is binding on appeal. The court also found that plaintiffs were entitled to sue for permanent damage but were limited by the statute of limitations to damages suffered within three years prior to the commencement of the action. The measure of permanent damages would be the difference in value of the land before and after the alleged damage. (Robinson-Florida)

TOWN OF SMITHFIELD V CITY OF RALEIGH (CITY'S DISCHARGE OF RAW SEWAGE INTO ANOTHER CITY'S WATER SOURCE).
207 NC 597, 178 SE 114-116 (1935).

Descriptors: *North Carolina, *Water pollution sources, *Water supply, *Sewage disposal, Judicial decisions, Legal aspects, Wastes, Waste disposal, Waste water (Pollution), Waste water disposal, Water pollution, Water rights, Water sources, Water resources, Water utilization, Water users, Sewage, Sewers, Streams, Rivers, River flow, Cities, Remedies, Legislation.

Plaintiff town brought an action to enjoin defendant city from discharging untreated sewage into creeks that fed the Neuse River, from which plaintiff derived its water supply. Defendant had no modern sewage treatment plant, and the discharge of raw sewage was a statutory violation. Plaintiff operated a water treatment plant which extracted and treated water from the river. Defendant was a much larger city than plaintiff and plaintiff had not suffered harm. Plaintiff alleged that such discharges were a menace to the health of its citizens, and defendant alleged that there was no menace or detriment to plaintiff. The trial court denied plaintiff's petition. The Supreme Court of North Carolina affirmed, after weighing the relative hardships of the inhabitants of both cities. The court further held that defendant must comply with the statute prohibiting such discharges even though temporarily excused because of financial conditions. Actual injury is not required to enjoin a municipality from discharging raw sewage into another town's water source; a threat of harm is sufficient. (Robinson-Florida)
W71-09107

KELLUM V VILLAGE OF GREENUP (UNRECORDED EASEMENT TO DISCHARGE SEWAGE).
265 Ill App 24-26 (1932).

Descriptors: *Illinois, *Pollution abatement, *Easements, *Municipal wastes, Fouling, Odor, Sewage sludge, Sewers, Sewage disposal, Water rights, Sewage effluents, Water pollution, Pollutants, Legal aspects, Judicial decisions, Sewage, Fresh water.

Plaintiff landowner sought to enjoin defendant village from discharging sewage into an open watercourse on property which she operated as a dairy. Defendant operated a sewer which emptied into an open stream crossing plaintiff's land. The evidence showed that the stream became so polluted that: (1) the cows crossing the stream had to be cleaned before they could be milked; (2) deposits of sewage and sludge beds were formed on the land and, at times, emitted an offensive odor; and (3) plaintiff had made numerous complaints to defendant. Defendant claimed that it had purchased an easement from the former owners before they sold the land to plaintiff. The alleged easement granted to defendant the right to carry sewage across the premises. The evidence showed that such an easement was never recorded and plaintiff had no knowledge of it. The easement granted only the right to lay the sewer across plaintiff's land and did not give defendants the right to run the sewage into the open stream. The Appellate Court of Illinois found that the evidence supported the trial court's granting of the injunction. An unrecorded easement was held to be no defense to such an action. (Johnson-Florida)

MILLER V MOBILE AND OHIO RR (INADEQUATE DRAIN BENEATH RAILROAD EMBANKMENT).
265 Ill App 414-420 (1932).

Descriptors: *Illinois, *Floods, *Obstruction to flow, *Storm runoff, Repulsion, Tile drainage, Rain water, Legal aspects, Judicial decisions, Watersheds (Basins), Water rights, Drainage systems, Flood control, Flood damage, Maximum

probable flood, Precipitation excess, Streams, Runoff, Drainage, Drains.

Plaintiff's land was in a basin bordered on one side by defendant railroad's embankment. A stream passed under the railroad north of plaintiff's land. Defendant's trestle crossing the stream had previously been sufficient to allow any overflow to pass through. Defendant later filled the trestle with earth and constructed a five-foot drain to carry the water through the embankment. The drain was insufficient to carry the natural flow of water resulting from frequent rains over a short period. Plaintiff's land was flooded, and he sued for the damages. The U.S. Appellate Court of Illinois held that there could be no recovery for damages if the rains were unprecedented acts of God, unless defendant was guilty of negligence which was a proximate cause of the damage. The jury found that the rains were not unprecedented and the court felt that the use of the five-foot drain in place of the trestle might have been negligent. One who restrains the flow of water must provide for the consequences of heavy rainfall and will be liable if he fails to do so. (Johnson-Florida)

LOVE V NASHVILLE AGRICULTURAL AND NORMAL INSTITUTE (MEASURE OF DAMAGES FOR SPRING POLLUTION).
6 Tenn App 104-111 (1927).

Descriptors: *Tennessee, *Springs, *Water pollution, *Damages, Water pollution sources, Water pollution effects, Pollutants, Sewage, Rent, Mineral water, Spring waters, Judicial decisions, Legal aspects.

Plaintiff landowner sought an injunction to prevent defendant school from discharging sewage so that his sulfur spring was contaminated and damages for both loss of profits from sales of the sulfur spring water and depreciation of this property. From a lower court decision holding defendant liable, both parties appealed on the measure of damages. Plaintiff contended that the lower court should have considered damages for diminished reputation of his spring water, depreciated property value, and lost profits from water sales. Conversely, defendant contended that the chancellor did not consider contamination from other sources, and that he erred in holding that defendant must prove contamination from other sources. The Tennessee Court of Appeals held that plaintiff could not obtain the special damages, since they were not pleaded and proven. As to defendant's assignments of error, the court held that defendant had the burden of proving other sources of contamination and what portion of the injury was caused by other sources. General rules for measuring damages for both permanent and temporary injuries were outlined by the court. (Hart-Florida)

FIRST TRUST CO V PEPPER BROS (RECOVERY OF DAMAGES FOR DESTRUCTION OF ICE CROP BY OIL POLLUTION).
235 App Div 750, 256 NYS 752-753 (1932).

Descriptors: *New York, *Ice, *Oil, *Damages, Water pollution, Impaired water quality, Gasoline, Water pollution sources, Industrial wastes, Oily water, Judicial decisions, Legal aspects, Water pollution effects.

Plaintiff brought suit to recover damages for injury to his ice crop. These damages were allegedly sustained by reason of defendant's permitting lubricating oil from its gasoline pumps to enter a creek. A verdict for plaintiff was entered at the trial term. On appeal the Supreme Court of New York found sufficient evidence to sustain the verdict for plaintiff as to liability, but not as to the amount of damages. The court stated that the jury could not award damages for water diverted, for loss of domestic water supply, or for loss of plaintiff's customers. The only elements of damage allowable were loss of ice harvest, loss by extra shrinkage of the ice actually harvested due to failure to fill the icehouse, and the expense of harvesting and insuring such extra shrinkage ice. Upon determination of the value of such damages the court found the award must be reduced. (Barnett-Florida)

CITY OF HARRISONVILLE V W S DICKEY CLAY MFG CO (REMEDY FOR MUNICIPAL POLLUTION OF PRIVATE PROPERTY).
289 US 334, 53 S Ct 602-605 (1933).

Descriptors: *Missouri, *Municipal wastes, *Sewage treatment, *Sewage effluents, Remedies, Judicial decisions, Legal aspects, Damages, Streams, Local governments, Farms, Sewage disposal, Pipes, Water pollution, Water pollution sources, Pumping plants, Cities.

Plaintiff manufacturing company sought damages from defendant city and an injunction to stop defendant from discharging effluent into a creek on a stock farm plaintiff owned. Defendant had removed 60 per cent of the organic matter from the effluent and it would cost $30,000 to build a secondary treatment plant to remove another 30 per cent of the matter. The lower appellate court barred an injunction, and plaintiff appealed, contending that the injunction should be granted because the discharge constituted a permanent nuisance. Defendant argued that damages for depreciation in property value was the proper remedy. The United States Supreme Court held that the discharge was a nuisance, but that in this case an injunction was not the proper remedy because it would work disproportionate hardship on defendant. The farm's loss in rental value could be remedied by money damages. The Court also held that the disposal plant was not a permanent nuisance since secondary treatment could be added. The case was remanded for determination of damages. (Morris-Florida)

FRANK TEA AND SPICE CO V L SCHREIBER AND SONS CO (PROPERTY DAMAGES FROM BLOCKAGE OF SEWER BUILT TO REPLACE NATURAL STREAM).
20 Ohio App, 151 NE 801-802 (1925).

Descriptors: *Ohio, *Municipal wastes, *Sewers, *Drainage systems, Legislation, Cities, Storm drains, Sewage disposal, Flood damages, Surface waters, Running waters, Natural streams, Waste disposal, Pumping, Riparian rights, Easements, Environmental sanitation, Public health, Waste disposal.

The city of Cincinnati built a drain running through all property bordering on Deer Creek. The creek was filled and the drain lay 50 feet below the surface. The drain was never made a part of the city sewer system, although it was used as a storm drain. Prior judicial opinions clarified the purpose of the drain: to replace the creek by superseding it with a sewer which to each property owner should be a quasi-natural stream, subjecting each to no new obligations. Plaintiff property owner sought to enjoin defendant's dumping sewage into the drain and to recover damages resulting from pumping out his basement, which was flooded as a result of blockage in the drain. The Court of Appeals of Ohio denied recovery of damages, finding that: (1) there was no rational means to assess the amount of damages caused by defendant since his sewage was in small proportion to the volume claimed to have been pumped out; and (2) it was possible that plaintiff failed to use due care while pumping to minimize damages. Defendant was enjoined from using the drain to dispose of sewage, since such use directly contravened the health regulations of the state set forth in a sanitary code. (Rees-Florida)

JOYCE-WATKINS CO V INDUSTRIAL COMM'N (LOW-WATER MARK AS BOUNDARY BETWEEN COTERMINUS STATES).
325 Ill 378, 156 NE 346-349 (1927).

Descriptors: *Illinois, *Low water mark, *Boundaries (Property), Bank erosion, Channel erosion, Rivers, Thread of the stream, Boundary disputes, Kentucky, Railroads, Working conditions, Personnel, Employment, Compensation, Accretion (Legal aspects), Ownership of beds, Ohio River.

Defendant employee was injured on plaintiff employer's railway that extended 260 feet into the Ohio River at a point 10 feet from the water's edge. Plaintiff contended the injury occurred outside the jurisdiction of Illinois, rendering an Illinois compensation award invalid. The Illinois Supreme Court held that the question of a boundary line between Illinois and Kentucky could not be determined, since Illinois was not a party to the action. However, the court did decide that the low-water mark of the river, constituting the boundary between these coterminus states, was not a permanent line. The court took judicial notice that the Ohio River varies in water level. It ruled that when a stream dividing coterminus states alters its course by a gradual process of alluvion, the boundary shifts with the stream. However, alteration by sudden changes leaves the boundary in the river's middle. Testimony from experienced riverme established the various levels of the Ohio River; the court concluded that the injury occurred north of the low-water mark. The compensation award by the Illinois Industrial Commission under the state Workmen's Compensation Act was upheld. (Rees-Florida)
W71-09176

NAGY V CITY OF AKRON (MUNICIPAL SURFACE WATER DRAINAGE).
27 Ohio App 250, 161 NE 226-228 (1927).

Descriptors: *Ohio, *Surface drainage, *Storm runoff, *Surface runoff, Judicial decisions, Surface waters, Laterals, Storm drains, Damages, Drainage, Drainage water, Drainage systems, Legal aspects.

Plaintiff landowner sued defendant city for damages to his crops caused by overflow from a county drainage lateral which passed through plaintiff's land. Plaintiff's complaint alleged that the overflow resulted from defendant's storm water sewer emptying into the lateral at a point 1000 feet outside defendant's corporate limits. The lateral was a watercourse under Ohio law. Defendant denied liability because only the flow and not the drainage area of the lateral had been increased by defendant's storm sewer drainage. The trial court sustained defendant's demurrer and the Court of Appeals of Ohio reversed. The court treated defendant municipality as an individual landowner in applying the civil law rule for surface water drainage. While acknowledging the rule that a landowner may, without liability, drain surface water into a natural watercourse upon his land and thus increase the volume and flow of the watercourse, the court pointed out that the watercourse in the instant case did not at any point come within defendant's corporate limits. The court therefore held plaintiff's complaint to state a cause of action. (Madsen-Florida)

PRIVATE REMEDIES FOR WATER POLLUTION.
Columbia Law Review, Vol 70, p 734-756, 1970.
23 p, 139 ref.

Descriptors: *Water pollution control, *Water quality control, *Remedies, *Social impact, Riparian rights, Legal aspects, Water law, Reasonable use, Natural flow doctrine, Water pollution, Water quality, Administration, Administrative agencies, Administrative decisions, Judicial decisions, Water policy, Industrial wastes, Social values, Political aspects, Damages, Legislation.

he following common law bases of a cause of action for water pollution are discussed: (1) riaprian ghts, (2) public nuisance, and (3) private uisance. Recovery of damages and suits for inctive relief are also considered. Available defens and their effect on these actions are examined. rivate actions based on statutes and constitutional rovisions are next considered. The possibility of hallenge by private individuals to administrative ction in environmental control is evaluated. hough federal and state pollution programs are ecoming increasingly important, private litigation ill provides economic and political stimulants to overnment and industry and fills gaps and rnishes individual remedies where pollution proams lack specificity. Private litigation also points t relevant issues to legislators and administrators. ctions for damages will encourage private indus- to reevaluate the social costs of pollution, and ass actions can increase this economic pressure. he author concludes that while comprehensive ans must come from the legislature, the courts ust educate and coerce compliance with new enronmental standards. (Robinson-Florida)

WATER AND ENVIRONMENTAL QUALITY IMPROVEMENT ACT OF 1970.
Public Law No 91-224, 84 Stat 91, 4 US Code Cong and Admin News, p 539-570 (1970). 32 p.

Descriptors: *Water pollution, *Environment, *Water quality, *Administrative agencies, Water pollution control, Oil, Oil industry, Oil fields, Pollutants, Pollution abatement, Water pollution sources, Water pollution effects, Sewage, Sewage disposal, Ships, Acid mine water, Mine water, Mine wastes, Alaska, Grants, Government finance, Federal government, Lakes.

The first of two parts of the Water and Environmental Quality Improvement Act of 1970 is wholly concerned with water quality improvement. The topic initially covered in the water quality section is control of pollution by oil. Strict liability for oil pollution is the impetus of the section. Further water quality topics are: (1) control of hazardous polluting substances; (2) control of sewage from vessels; (3) area acid and other mine water pollution control demonstrations; (4) pollution control in the Great Lakes; (5) training grants and contracts; (6) applications for training grants or contracts; allocation of grants or contracts; (7) award of scholarships; (8) definitions and authorizations; (9) Alaska village demonstration projects; and (10) cooperation by all federal agencies in the control of pollution. The second part of the Act is devoted to environmental quality; after first stating the findings, declarations, and purposes of Congress in enactment, regulations are promulgated governing: (1) the Office of Environmental Quality; (2) environmental quality reports; and (3) authorized expenditures. (Hart-Florida)

LAW AND TAXATION--A GUIDE FOR CONSERVATION AND OTHER NONPROFIT ORGANIZATIONS.
Conservation Foundation, Washington, D. C.

The Conservation Foundation, Wash, DC, June 1970, 47 p, 7 ref.

Descriptors: *Taxes, *Conservation, *Environment, *Legal aspects, Legislation, Ecology, Financing.

Important considerations for any group created for the purpose of conservation or environmental improvement are the tax implications of the organizational form. This article attempts to provide a guide in these areas. The article begins with a discussion of the advantages and disadvantages of the corporate form with respect to taxation. Public foundations are defined. The emphasis is placed upon the tax situation of corporations, and particularly on the ways of securing and maintaining tax exempt status. Also included is a section devoted to the considerations of private foundations. (Duss-Florida)
W71-09199

WATER QUALITY ACT OF 1965 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO ESTABLISH THE FEDERAL WATER POLLUTION CONTROL ADMINISTRATION.
Senate Bill 4, 89th Cong, 1st Sess (1965). 11 p.

Descriptors: *Water Quality Act, *Water pollution control, *Pollution abatement, *Standards, Water pollution, Water quality control, Sewage disposal, Sewage treatment, Water resources development, Administration, Administrative agencies, Regulation, Water pollution treatment, Treatment facilities, Water allocation (Policy), Water conservation, Legislation, State governments, Municipal wastes, Industrial wastes, Cities, Local government, Grants, Research and development, Legal aspects.

In order to enhance the quality of water resources and establish a national policy for water pollution abatement, the Federal Water Pollution Control Act would be amended by this legislation to establish the Federal Water Pollution Control Administration. Grants would be authorized to states, municipalities and appropriate agencies for research and development of improved methods of sewage discharge, subject to various limitations. Provisions relating to appropriations would also be amended. Grants would be increased for construction of municipal sewage treatment works as part of comprehensive water quality plans. After consultation with the applicable federal or state agencies, the Secretary of Health, Education and Welfare would be authorized to prepare regulations setting forth water quality standards for interstate waters. In establishing such standards, the Secretary could take into consideration public water supply needs, propagation of fish and wildlife, recreational purposes, and other uses of the waters. Before the standards would be promulgated, states and interstate agencies would be given an opportunity to develop their own standards in accordance with the purposes of the Act. Discharge in derogation of water quality standards would be subject to abatement. (Smiljanich-Florida)
W71-09200

AN ACT FOR A COMPREHENSIVE WATER AND RELATED LAND RESOURCES MANAGEMENT PROGRAM (THE ARKANSAS WATER PLAN).
Act 217, Acts of Arkansas, p 682-693 (1969). 12 p.

Descriptors: *Arkansas, *Water resources development, *Administration, *Planning, Water resources, Land resources, Water management (Applied), Water policy, Project planning, Project purposes, Water allocation (Policy), Water supply, Water utilization, Financing, Government finance, Debt, Income, Institutions, State jurisdiction, State governments, Local governments, Administrative agencies, Legislation, Legal aspects.

The Arkansas Soil and Water Conservation Commission is directed by this Act to prepare, develop and engate the Arkansas Water Plan, a comprehensive program for the orderly development and management of the state's water and related land resources. The Commission is authorized to engage in any water development project that is to be included in the Plan. In using appropriated funds the Commission may provide the cost of planning, acquisition, construction and maintenance of the water development projects. The Commission is authorized to establish the Arkansas Water Development Fund, which shall be used to pay for the water development projects. Among the powers and duties of the Commission are the responsibility for the proper distribution and allocation of state water and for other necessary administrative functions. Provision is made for the creation and issuance by the Commission of

revenue bonds to secure the payment of the project costs, subject to various limitations. Penalties for violation of the Act are set forth. (Smiljanich-Florida)
W71-09201

STATE CORPORATE INCOME TAX DEDUCTIONS FOR AMOUNTS INVESTED IN ANTI-POLLUTION DEVICES, SYSTEMS AND FACILITIES.
Act No 1136, Acts of Alabama, p 2115-2122 (1969). 8 p.

Descriptors: *Alabama, *Taxes, *Pollution abatement, *Income, Treatment facilities, Water pollution, Air pollution, Water pollution control, Water pollution treatment, Government finance, Tax rate, State governments, Net income, Costs, Return (Monetary), Amortization, Legislation, Legal aspects, Industries.
Identifiers: *Tax deductions.

A prior act providing for certain state corporate income tax deductions is hereby amended to include deductions for anti-pollution devices. All amounts invested in devices, systems or facilities used or placed in operation in the state primarily for the protection of the public interest through the abatement of air and water pollution shall be allowable as deductions in computing the state corporate income tax. In lieu of such deduction the amounts invested may be amortized. Any deductions taken under this Act shall exclude all other allowable deductions for such investment. (Smiljanich-Florida)
W71-09202

AN ACT PROVIDING FOR TAXATION DEDUCTION OF COST OF POLLUTION ABATEMENT DEVICES.

Act No 1140, Acts of Alabama, p 2131-2134 (1969).

Descriptors: *Alabama, *Pollution abatement, *Taxes, *Assessments, Treatment facilities, Evaluation, Water pollution control, Water pollution, Air pollution, Water pollution treatment, Water quality control, Government finance, Tax rate, Property values, Legislation, Legal aspects, Non-structural alternatives.

An existing act providing for the taxation of corporations is by this act amended to include certain deductions. A corporation may deduct from the assessed value of its shares the assessed value of all devices, systems and facilities constructed, used or placed in operation in the state primarily for the protection of the public interest through the abatement of air and water pollution. Taxation shall be only on the assessed value of the remainder. (Smiljanich-Florida)
W71-09203

AN ACT PROVIDING FOR THE EXEMPTION OF STATE USE TAXATION OF POLLUTION ABATEMENT DEVICES OR FACILITIES.
Act No 1141, Acts of Alabama, p 2134-2136 (1969).

Descriptors: *Alabama, *Pollution abatement, *Taxes, *Treatment facilities, Water pollution control, Water pollution treatment, Air pollution, Water pollution, Water quality control, Government finance, Tax rate, Industrial plants, Legislation, Legal aspects.

An existing act providing for the exemption from the state use tax of certain property and proceeds is hereby amended to include pollution abatement devices. The storage, use or consumption of any devices, systems, facilities, or materials used or placed in operation within the state primarily for the protection of the public interest through the abatement of air and water pollution shall be exempt from state use taxation. (Smiljanich-Florida)
W71-09204

ENVIRONMENTAL IMPROVEMENT AUTHORITIES ACT OF 1969.
Act No 1117, Acts of Alabama, p 2060-2072 (1969). 13 p.

Descriptors: *Alabama, *Pollution abatement, *Institutions, *Water pollution, State governments, Administrative agencies, Water resources development, Administration, Management, Surveys, Planning, Water management (Applied), Water pollution treatment, Water quality control, Air pollution, Environmental sanitation, Local governments, Environment, State jurisdiction, Environmental effects, Taxes, Debt, Treatment facilities, Legislation, Legal aspects.

Authorization is hereby given for the creation of public corporations as authorities for the study, control, abatement and prevention of water, air or general environmental pollution. Such authorities may: (1) undertake engineering, technical, financial, legal, and other studies and surveys with respect to water and other environmental pollution problems and hazards; (2) construct, acquire, operate and control equipment, facilities and systems for the abatement of water and other environmental pollution problems; and (3) cooperate with and lend financial assistance to municipalities, counties and industries in matters and undertakings, the end purposes of which are pollution abatement. Procedures for incorporation are set forth, along with the composition of such corporations and certain tort immunities and tax exemptions. The authorities shall have normal corporate powers and may issue bonds secured by statutory mortgage liens to finance their operations. The public corporations shall cooperate with political subdivisions and other agencies and instrumentalities of the state whenever necessary. (Smiljanich-Florida)
W71-09205

AN ACT PROVIDING FOR THE INCORPORATION OF PUBLIC WATER, SEWER AND FIRE PROTECTION DISTRICTS.
Act No 29, Acts of Alabama, p 2630-2652 (1970).

Descriptors: *Alabama, *Water districts, *Public utility districts, *Sewage districts, Local governments, State governments, Water works, Water distribution (Applied), Water rates, Water supply, Sewage disposal, Municipal wastes, Sewage treatment, Treatment facilities, Eminent domain, Boundaries (Property), Debt, Loans, Investment, Government finance, Taxes, Legislation, Legal aspects.

Upon application to and authorization by a county or municipality, water, sewer and fire protection districts may be incorporated as public corporations for the provision of applicable services. Such districts are authorized to acquire, construct, operate, improve and finance water works plants, water distribution systems, sanitary sewer systems and fire protection facilities. The power of eminent domain is conferred on the districts. Provisions are set forth for the procedures of incorporation, the boundaries of the districts, their governance and other necessary powers. Procedures relating to the establishment, revision and collection of charges for the district services are included. Authorization is given for the financing of corporate purposes through interest bearing revenue bonds and other securities payable out of the revenues of the systems or facilities and secured by statutory mortgage liens. The districts may distribute and sell water, furnish and provide sewer and fire protection services, or perform such services in any combination. The districts shall be exempt from taxation and shall have certain tort liability immunities. Provisions for the dissolution of the districts and disposition of their property are also included. (Smiljanich-Florida)

CERTIFICATION OF WATER AND WASTE WATER TREATMENT PLANT OPERATIONS ACT.
General Act No 210, Georgia Laws, p 272-278 (1969). 7 p.

Descriptors: *Georgia, *Treatment facilities, *Operation and maintenance, *Management, Waste water treatment, Waste water disposal, Waste water (Pollution), Pollution abatement, Water pollution treatment, Water treatment, Water pollution, Employment, Engineering personnel, Occupations, Working conditions, Personnel, Leadership, Permits, Administrative agencies, Adjudication procedure, Administration, Legislation, Legal aspects.

In order to protect the public health and welfare and to conserve and protect the water resources of the state, this Act hereby requires the certification and examination of all water and waste water treatment plant operators. The State Board of Examiners for Certified Water and Waste water Treatment Plant Operators is created. The Board shall classify all public water supply systems and waste water treatment plants as to size, type, character of water to be treated, and other physical conditions indicating the skill, knowledge and experience that the operator must have to successfully operate each type of plant and prevent unlawful pollution. Provisions for application, examination and issuance of certificates to operators are included, and penalties for violations of the Act are prescribed. The Board may revoke the certificate of an operator, after a hearing, when it is found that the operator has practiced fraud or deception, that reasonable care was not used in the performance of his duties, or that the operator is incompetent or unable to properly perform his duties. Judicial review is provided for such revocations. (Smiljanich-Florida)
W71-09207

GUIDELINES FOR AGENCY STATEMENTS ON PROPOSED FEDERAL ACTIONS AFFECTING THE ENVIRONMENT.
Council on Environmental Quality, Wash, D.C.

Federal Register, Vol 36, No 79, p 7724-7729 (April 1971). 6 p.

Descriptors: *Administrative agencies, *Adoption of practices, *Environmental effects, *Federal project policy, Legislation, Administration, Regulation, Ecology, Environment, Federal government, Clean Air Act, Federal jurisdiction, Water quality control, Pollution abatement, Water resources, Natural resources, Water resources development, Water pollution, Air pollution, State governments, Local governments, Legal aspects.
Identifiers: *National Environmental Policy Act.

The Council on Environmental Quality herein provides guidelines to federal departments, agencies and establishments for preparing detailed environmental statements on proposals for legislation and other major federal actions significantly affecting the quality of the human environment as required by the National Environmental Policy Act. The objective of the guidelines is to build into the agency decisionmaking process an appropriate and careful consideration of the environmental aspects of proposed action, including proposed water quality standards, and to assist agencies in implementing the EPA. Prior to agency decision concerning major actions or recommendations that significantly affect the environment, federal agencies will, in consultation with other appropriate federal, state and local agencies, assess in detail the potential environmental impact. Agency procedures are provided for: the types of actions which will require such reports, state and local review of the environmental impact, and the content of the environmental statements. Guidance for implementation of the Clean Air Act is also provided. Appended hereto are forms which should accompany each environmental statement and a list of federal agencies with jurisdiction by law or special expertise to commen

n various types of environmental impacts. (Smil-nich-Florida)

he substandard water quality of the nation's reams, lakes and estuaries presents a large de-and for waste water treatment facilities. Regional onsolidation of wastes and treatment in fewer and rger facilities is an advantageous method of meet-g this demand. Although some public assistance ay be expected, industry should examine availa-e alternatives for treating its wastes to minimize sts. To date, limited success has been achieved in rious attempts at regional consolidation. There-re, more effective methods of planning and im-ementing the required facilities are necessary. To valuate technical feasibility, waste streams should e catagorized as to treatment processes and en-ronmental effects. The economic cost of feasible sposal modes should be determined and evalu-ed for environmental impact. Two approaches ist for advancing understanding of regional water uality control systems: (1) systems planning stu-es, and (2) technology studies. Since technology udies ignore systems interaction, the systems anning approach should be given priority. Once asibility is shown, systems planning studies would llow. Technology studies should also be utilized narrowly-defined areas. (Hart-Florida)

ITY OF FRANKFORT V SLIPHER (MU-ICIPAL SEWAGE DISPOSAL).
62 NE 241-247 (App Ct Ind 1928).

escriptors: *Indiana, *Municipal wastes, *Sewage isposal, *Treatment facilities, Riparian rights, Public health, Natural streams, Treatment, Pollutants, Sewers, Sewage effluents, Judicial decisions, Damages, Wastes, Waste treatment, Waste disposal, Legal aspects.

Plaintiff riparian owner sued defendant city for damages resulting from defendant's upstream discharge of untreated sewage into a natural stream bordering plaintiff's farm. On appeal from a judgment for plaintiff, defendant contended that: (1) a municipality may lawfully discharge untreated sewage into a stream which is a natural outlet, providing the discharge is not negligent, and (2) it's actions did not constitute a public nuisance. In affirming, the Appellate Court of Indiana held that defendant was negligent in failing to utilize available technology to construct a sewage treatment facility. The court reasoned that, although defendant was authorized by statute to build and maintain sewers, public necessity did not require the discharge of untreated sewage which could have been purified at a reasonable cost. MITCHELL REALTY CO V CITY OF WEST ALLIS (EXTENT OF DAMAGES CAUSED BY CITY'S POLLUTION OF STREAM).
206 NW 193-195 (Wis 1925).

Descriptors: *Wisconsin, *Water pollution, *Water pollution sources, *Damages, Streams, Sewage, Overflow, Land, Land tenure, Effluents, Sewage effluents, Sewers, Outlets, Industrial wastes, Judicial decisions, Legal aspects, Cities, Adjudication procedure.

Plaintiff landowner sought to recover damages for injury to his property caused by defendant city's pollution of a stream which overflowed plaintiff's land and decreased its agricultural value. Originally, plaintiff had brought suit against defendant and a private corporation which also contributed to the pollution. Plaintiff had received judgment but the Supreme Court of Wisconsin reversed on grounds not relevant to the present appeal. At the second trial damages were computed principally by referring to the testimony given in the first trial. Defendant appealed, contending that the trial court had failed to require plaintiff to establish within a reasonable certainty the damage caused by defendant and that a new determination was required as to the extent of damage caused by defendant. The Supreme Court of Wisconsin affirmed, holding that the evidence at the prior trial was sufficient to show the proportion of damage caused by defendant city. (Duss-Florida)

WAGNER V TOWN OF CONOVER (CITY'S LIABILITY FOR DISCHARGE OF SEWAGE INTO STREAM).
156 SE 167-169 (NC 1930).

Descriptors: *North Carolina, *Cities, *Water pollution, *Sewage, Water pollution effects, Water pollution control, Water pollution sources, Sewerage, Pollutants, Water law, Discharge (Water), Adjudication procedure, Judicial decisions, Legal aspects, Springs, Swimming pools, Streams, Riparian rights.

Plaintiff landowner sued defendant municipality for damages resulting from the discharge of city sewage into a stream which ultimately flowed through plaintiff's land. Plaintiff showed that a spring in the stream bank disappeared after defendant began discharging sewage, and that the stream water was used for a swimming pool. This evidence was held competant. Defendant asserted that the lower court's charge to the jury with respect to injury to health from maintainance of sewerage flow was prejudicial. The North Carolina Supreme Court held that, since no evidence or contention of injury to health was presented, the charge did not harm defendant. Defendant further contended that the lower court's charge that, if permanent damages were awarded, defendant would have an easement to continue discharge was reversible error. Nevertheless, the lower court's charge was upheld. The court observed that plaintiff had a right to have the issue of permanent damages presented to the jury. The lower court's decision for plaintiff was affirmed. (Hart-Florida)

CITY OF BARNESVILLE V PARHAM (CITY'S LIABILITY FOR DISCHARGING SEWAGE INTO OPEN STREAM).
160 SE 879-880 (Ga Ct App 1931).

Descriptors: *Georgia, *Cities, *Sewage, *Damages, Rent, Streams, Water pollution, Odor, Water pollution effects, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff dairy farmer sued defendant city for damages from the discharge of sewage into a stream running through plaintiff's land. The sewage caused obnoxious odors on plaintiff's land. Plaintiff sought damages for the impaired rental value of his land. The Georgia Court of Appeals stated that plantiff might recover damages for the impaired rental value, and that the measure of damages was the diminution in rental value attributable to the injury. Furthermore, plaintiff's allegations that he lost profits from his dairy operation were upheld as equivalent to rental value for determining damages. However, the lower court's failure to instruct the jury on the proper measure of damages was held reversible error. (Hart-Florida)

SANITARY DIST OF CHICAGO V CHICAG PACKING CO (DISCHARGE OF STOCKYARD WASTE INTO SEWAGE CHANNEL).
241 Ill App 288-314 (1926).

Descriptors: *Illinois, *Sewage, *Channels, *Waste disposal, Cities, Administrative agencies, Waste treatment, Sewage treatment, Lake Michigan, Rivers, Water pollution control, Waste dilution, Waste assimilative capacity, Solid wastes, Municipal wastes, Legal aspects, Judicial decisions, Legislation.

Plaintiff sanitary district sought to enjoin defendant packing company from discharging trade wastes into plaintiff's sanitary channel. Plaintiff was organized to construct a channel to divert Chicago's municipal sewage into the Des Plaines River, away from Chicago's Lake Michigan water supply. Plaintiff contended the legislation did not contemplate discharge of solid trade wastes into the channel along with sewage and that defendant's trade wastes were not diluted or oxidized by the water, therefore creating a malodorous nuisance. Defendant contended that plaintiff was required by the applicable legislation to accept their trade wastes. The Illinois Appellate Court found that the legislation stated that before sewage was discharged, all garbage, dead animals, and parts thereof should be taken therefrom. Accordingly, it held that defendants could not discharge their wastes into the channel. Defendant's contention that plaintiff had no jurisdiction over Chicago's sewers and could not object that defendant discharged trade wastes into them was rejected. (Hart-Florida)

AN ANALYSIS OF ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR IMPLEMENTING AN INTEGRATED WATER SUPPLY AND WASTE MANAGEMENT PROGRAM IN THE WASHINGTON METROPOLITAN AREA,
Institute for Defense Analyses, Arlington, Va. International and Social Studies Div.
Paul S. Hughes.
Available from the National Technical Information Service as PB-198 012, $3.00 in paper copy, $0.95 in microfiche. Institute for Defense Analyses Paper P-714, Mar 1971. 103 p.

Descriptors: *Water supply, *Waste treatment, *Institutional constraints, *Urban sociology, Waste disposal, Waste water disposal, Water reuse, Mathematical models, Sewage treatment, Solid wastes, Maryland, District of Columbia.
Identifiers: Water reclamation, Management engineering, Maryland, *Solid waste management, Washington metropolitan area, Potomac River basin.

The purpose of this paper is to consider what type of institutional machanism would be most appropriate for implementing an integrated water supply and waste management program in the Washington metropolitan area. Such a program is defined as one which contains comprehensive planning responsibilities cutting across many services, but which provides wholesale operating capability in the areas of water supply, waste water treatment, and solid waste management.

C N O AND T P RY CO V MOON (DUTY OF RAILROAD TO MAINTAIN DRAINAGE DITCH).

2 Tenn App 477-482 (1926).

Descriptors: *Tennessee, *Railroads, *Ditches, *Surface drainage, Right-of-way, Easements, Surface runoff, Drainage water, Overland flow, Rain water, Culverts, Drains, Drainage effects, Boundaries (Property), Prescriptive rights, Natural flow doctrine, Obstruction to flow, Judicial decisions, Legal aspects.

Plaintiff landowner sued defendant railroad for damages caused by the overflow of a drainage ditch along the railroad right-of-way. Plaintiff contended that the railroad had negligently allowed the ditch to become filled up, thus causing drainage water to back up and damage plaintiff's land. Defendant contended that, due to maintenance of the drainage ditch for more than twenty years, it had acquired rights by prescription. Defendant also contended that plaintiff had title to the drainage ditch and the duty to keep it open. In affirming a verdict and judgment for plaintiff, the Tennessee Appeals Court, Eastern Section, noted that the ditch along the right-of-way had been dug by the defendant for the purpose of providing and protecting the natural drainage of plaintiff's land. It is the duty of a railroad to provide ditches for the natural drainage of land along its right-of-way. Plaintiff therefore had no duty to go onto the right-of-way and clear the ditch. The railroad, in previously keeping the ditch open, thereby recognized plaintiff's right to have his surface drainage free from obstruction, and could claim no rights by prescription. (Smiljanich-Florida)

SCHLESSINGER V ROSENHEIM (LIABILITY OF TENANT FOR DRAINAGE OF RAIN WATER FROM ROOF ONTO NEIGHBORING BUILDING).
2 Tenn App 529-535 (1926).

Descriptors: *Tennessee, *Roofs, *Rain water, *Drainage, Drainage effects, Surface drainage, Repulsion (Legal aspects), Land tenure, Drainage water, Remedies, Damages, Leases, Buildings, Rainfall, Runoff, Drainage practices, Judicial decisions, Legal aspects.

Plaintiff store owner sued defendants, a landlord and a tenant, for an injunction and for damages caused by water being dumped onto plaintiff's roof from an adjoining building. Plaintiff contended that rainwater was drained from defendant's roof by a downspout onto plaintiff's roof, thereby damaging his store. Defendant landlord contended that the tenant was solely responsible for any damage. Defendant tenant contended that he had not constructed the spout and was under no duty to remove it, and that the water from his roof had wrongfully been drained onto his building from another building. In affirming a lower court judgment for plaintiff, the Tennessee Appeals Court, Eastern Section, noted that the tenant, not the landlord, was under a duty to keep the building in repair. Upon being notified it became the tenant's duty to remove the downspout, which was under his control and which he had no legal right to maintain. The fact that the water was being diverted onto the tenant's roof by another did not justify his diversion of the water onto plaintiff's roof. (Smiljanich-Florida)

SUMNER V O'DELL (INJUNCTION TO PREVENT POLLUTION OF SPRING WATER BY CATTLE).
12 Tenn App 496-500 (1930).

Descriptors: *Tennessee, *Water pollution, *Streams, *Reasonable use, Cattle, Domestic water, Riparian rights, Water quality, Spring waters, Springs, Legal aspects, Judicial decisions, Water pollution sources, Remedies, Relative rights.

Plaintiff lower riparian landowner sought to enjoin defendant upper riparian landowner from polluting the stream bordering their property. Plaintiff's and defendant's tracts were previously owned by one person, who conveyed plaintiff's tract first, along with the right to use the spring water flowing from defendant's tract. When defendant purchased the upper tract, he began using the lot through which the stream flowed as a confinement for cattle. The cattle polluted the water so that it was unfit for plaintiff's domestic uses. Apparently defendant's actions were purposeful, and with some malice, since the evidence presented clearly showed that defendant could have erected his fences to prevent pollution of the spring water. The Tennessee Court of Appeals held that defendant was utilizing his property unreasonably with respect to plaintiff's rights, and enjoined use of the lot as a cow pasture and path. (Hart-Florida)

LEGAL ASPECTS OF WATER USE AND CONTROL IN SOUTH CAROLINA. PART A -- LEGAL CONSIDERATIONS RELATING TO A NEW WATER RESOURCES LAW FOR SOUTH CAROLINA,
Clemson Univ., S.C. Water Resources Research Inst.
Charles H. Randall, Jr.
Available from the National Technical Information Service as PB-200 654, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Institute, Clemson University, Clemson, SC, Report No 20, Mar 1971. 68 p. OWRR Project B-003-SC (2).

Descriptors: *South Carolina, *Water resources, *Environmental effects, *Water policy, *Permits, Legal aspects, Legislation, Administrative agencies, Regulation, Water pollution, Judicial decisions, Rivers and Harbors Act, Land use, State governments, Coordination, Riparian rights.

Increasing and competing demands for water use have persuaded legislatures in many riparian states to enact statutes modifying traditional riparian rules. Some of these statutes incorporate elements of the appropriation system, and delegate to administrative agencies power to grant permits for water use. Other delegate to agencies power to declare emergency water areas, and to regulate withdrawals from such areas. Within recent years, increased concern for protection of the environment has led to statutes both Federal and State providing for inventory of water and related resources, large scale planning for water use and control, including water zoning, and extensive reorganization of administrative agencies to deal with these problems. South Carolina is experiencing population growth and industrial development, and is beginning to face some of the problems these statutes were designed to meet. These statutory developments are examined, with a view to their consideration by the administrative agencies and the General Assembly of South Carolina. Problems of State constitutional law relating to water use and control are also examined. (See also W71-09364)
W71-09363

LEGAL ASPECTS OF WATER USE AND CONTROL IN SOUTH CAROLINA. PART B -- SOUTH CAROLINA LAKES AND PONDS: A STUDY OF PUBLIC AND PRIVATE RIGHTS THEREIN,
Clemson Univ., S.C. Water Resources Research Inst.
David H. Means.
Available from the National Technical Information Service as PB-200 655, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Institute, Clemson University, Clemson, SC, Report No 21, Mar 1971. 45 p, append. OWRR Project B-003-SC (3).

Descriptors: *Lakes, *Legal aspects, *Vanigable waters, *Riparian rights, *Water law, Nonnavigable waters, Ownership of beds, Public rights, Recreation, Reservoirs, Water pollution.

The growing importance of South Carolina's lakes for commercial and recreational uses necessitates increased emphasis on a water resources policy. Accordingly, the law of lakes was surveyed insofar as such law may be applicable to the formulation of an overall regulatory scheme. In general the law classifies water as navigable or nonnavigable. In navigable waters the interest of the federal government is paramount, followed by that of the state, with the public interest prevailing over that of persons with private interests resulting from the ownership of land adjacent to the water. Where the water in question is nonnavigable the public as such has no interest therein, and the exclusive right to the enjoyment of such water, subject to the police power of the state, is in the riparian landowners, that is, those persons who own a portion of the bed of the nonnavigable water. In the regulation of competing interests in the use of water, the legal tools available include those of eminent domain and of statutes; the riparian system; and the use of restrictive covenants. (See also W71-09363)

SHELTON V MOSIER (PRESCRIPTIVE RIGHT OF MILL DAM OWNER TO OVERFLOW UPPER STREAM).
19 Ohio App 89-94 (1924).

Descriptors: *Ohio, *Mill dams, *Overflow, *Prescriptive rights, Dams, Floods, Backwater, Streams, Riparian land, Land tenure, Easements, Riparian rights, Competing uses, Obstruction to flow, Reasonable use, Natural flow doctrine, Relative rights, Riparian waters, Submergence, Judicial decisions, Legal aspects.

Plaintiff upper landowner sued defendant lower landowner for damages resulting from the overflow of a stream caused by defendant's mill dam. Plaintiff contended that water backed up by the dam damaged his crops and land. Defendant contended that the dam had been maintained in the same condition and height for more than twenty-one years and that defendant had therefore obtained a prescriptive right to dam the stream and cause its overflow. In reversing a lower court verdict and judgment for defendant, the Court of Appeals for Gallia County, Ohio, noted that defendant had not shown that the dam had been affecting the overflowed lands to the same degree for more than twenty-one years. When a right to overflow upper lands rest in prescription only, its extent is measured by the actual enjoyment of the easement, and not by the height of the dam maintained during that period. As defendant had failed to allege habitual or usual overflow during the period of prescription, his defense was inadequate, and the crucial question in the case had not been tried. (Smiljanich-Florida)

/ELLS V SHEETS (CITY'S LIABILITY FOR ANDOWNERS POLLUTING DITCH NOT ART OF THE CITY'S DRAINAGE SYSTEM).
13 Ky 438, 281 SW 159-162 (Ct App Ky 1926).

escriptors: *Kentucky, *Water pollution, *Cities, Drainage, Water pollution sources, Water pollu-on effects, Water quality, Ditches, Damages, egal aspects, Sewers, Drainage systems, Judicial ecisions.

laintiff landowner sued defendant city and defen-nt landowners to recover damages for pollution a natural drainage ditch flowing through plain-ff's lot. The ditch flowed along the rear of defen-nt landowners' lots, and they discharged their wage, garbage, and other refuse into it. The pol-ted water lay stagnant in the ditch on plaintiff's t, and created offensive odors and a breeding ace for mosquitoes. At trial, the complaint ainst defendant city was dismissed. On appeal, e remaining defendants contended that the city as jointly liable. The complaint contended that e landowners used the drain with the city's per-ission. The Court of Appeals of Kentucky held at the city could not be liable unless the drain ere part of its sewage system, and noted that the ty could not give permission to use the ditch un-ss it were part of the sewage system. Since the city ad not formally adopted the ditch as part of its wer system, the court upheld the lower court's smissal. Furthermore, the court held that the vidence supported the lower court's denial of de-ndant landowners notion for a directed verdict. Hart-Florida)

EAVER DAM COAL CO V DANIEL (POLLU-ION DAMAGE TO AGRICULTURAL LAND).

27 Ky 423, 13 SW2d 254-257 (1929).

escriptors: *Kentucky, *Riparian rights, *Mine astes, *Water pollution effects, Legal aspects, Ju-icial decisions, Remedies, Damages, Pollutants, lining, Mine drainage, Coal mines, Industrial astes, Water pollution sources, Path of pollutants, lood damage, Impaired water quality, Riparian aters, Waste disposal, Pollutant identification.

laintiff riparian owner obtained judgment against efendant coal mining company for damages to laintiff's land. Plaintiff alleged that a watercourse raining his land was polluted upstream by cop-eras and copperas water escaping from defen-ant's mine, and that when the watercourse over-owed, copperas was deposited on plaintiff's land, ecreasing its fertility. On appeal, defendant con-nded: (1) that it was absolved by an 'act of God', n unprecedented rain which caused the flood; (2) hat plaintiff could not recover because there was o negligence shown on defendant's part; and (3) hat defendant was liable only for one third of the amage to plaintiff's land, since the evidence howed that two thirds of the copperas water came rom mines other than defendant's. The Court of Appeals of Kentucky held that an 'act of God' would be a defense only if it were the proximate nd sole cause of the injury, and that it would as-ume that the jury assessed only the proportion of lamages shown by the evidence to have been aused by defendant's mine. The court also held hat plaintiff, as a riparian owner, need not show egligence, but only invasion of his rights by defen-lant. (Madsen-Florida)

CONESTEE MILLS V CITY OF GREENVILLE (CITY'S LIABILITY TO LOWER RIPARIAN OWNER FOR SEWAGE DISCHARGE).
158 SE 113-120 (SC 1931).

Descriptors: *South Carolina, *Water pollution, *Cities, *Sewage, Water pollution effects, Water pollution control, Water pollution sources, Pollution abatement, Pollutants, Odor, Legal aspects, Judicial decisions, Prescriptive rights, Rivers, Riparian rights, Discharge (Water).

Plaintiff lower riparian owner sued defendant city to recover damage from water pollution. Defendant was discharging sewage into the river adjacent to plaintiff's property in 1892, pursuant to legislation. The discharges resulted in fishkill, offensive odors, and contamination. Twenty years had elapsed before plaintiff sued, and defendant asserted a prescriptive right to continue the discharges. The pollution was characterized as a continuing nuisance, however, and no actionable injury had arisen previously; hence the South Carolina Supreme Court held that defendant had not acquired a prescriptive right to pollute. Defendant furthermore asserted that plaintiff purchased subject to the pollution. Since the pollution could be abated, the discharges were not characterized as an inverse condemnation and the court rejected the contention. The court also held that the statute of limitations did not bar actions for injuries occuring in the six years prior to suit. Accordingly, the lower court's decision in favor of defendant was reversed. (Hart-Florida)
W71-09383

BUCKLES V CITY OF DECATUR (LIABILITY OF CITY FOR POLLUTION OF RIVER).
234 Ill App 89-97 (1924).

Descriptors: *Illinois, *Water pollution, *Livestock, *Stock water, Water pollution effects, Water pollution sources, Cities, Sewage, Water quality, Potable water, Diseases, Mortality, Riparian rights, Natural flow doctrine, Pollutants, Waste disposal, Color, Odor, Fishkill, Toxicity, Taste, Farms, Judicial decisions, Legal aspects.

Plaintiff riparian landowner sued defendant municipality to recover damages for injury to livestock resulting from pollution of the river running along plaintiff's land. Defendant discharged its sewage into the river, and plaintiff's stock became ill, some dying, from drinking the polluted water. At trial, the jury found defendant not liable, and plaintiff appealed when his motion for a new trial was denied. The Illinois Appellate Court stated that a riparian owner has a right to the natural flow of the stream, and that one causing pollution was liable in damages. The court furthermore observed that a city was liable as any private person would be and that liability was unaffected by the size of the city. Following an extensive review of the evidence presented at trial, the court determined that defendant's evidence failed to refute the evidence presented by plaintiff. Accordingly, the court held that the verdict was contrary to the weight of the evidence and reversed and remanded for a new trial. (Hart-Florida)

This article discusses the conflict between private ownership of lakes and public need of open waters for recreational uses. The author describes the philosophical and economic implications of judicial control over private ownership of lake facilities. He concludes that states should develop long range plans for recreational development and make plans for the acquisition of private lakes for the public. (Holmes-Rutgers)

CHRISTIE V SANITARY DISTRICT OF CHICAGO (LIABILITY FOR EXCESSIVE DISCHARGE OF WATER).

256 Ill App 63-110 (1930).

Descriptors: *Illinois, *Sewage, *Flooding, *Electric power production, Cities, Waste dilution, Public health, Dams, Levees, Adjudication procedure, Legal aspects, Judicial decisions, Sewage treatment, Rivers, Lake Michigan, Flood damage, Canals, Design flow, Discharge (Water), Lakes.

Plaintiff riparian landowner sued defendant sanitary district for damages resulting from excessive discharge of water into the Illinois River. Defendant discharged water from Lake Michigan into a channel to dilute the sewage from Chicago, which flowed into the river. The authorized quantity of water was in direct ratio to Chicago's population. Plaintiff charged that defendant: (1) discharged more than the suthorized quantity; (2) the flowage was not continuous; and (3) discharged additional water to generate electricity. As a result, defendant's lands were flooded. The Illinois Appellate Court determined, however, that plaintiff's assertions ultimately reduced to a charge that defendant had increased the flow to an excessive amount. Defendant's activities had commenced in 1903, but plaintiff did not sue until 1923. The statute of limitations was five years. Since plaintiff was unable to show that defendant had increased the flow in the preceding five year period the court held that the lower court should have directed verdict for defendant. The court held that plaintiff's cause accrued when the increased flow reached the levels of 1904 and 1913. Furthermore, the court found that defendant did not injure plaintiff by construction of use of the channel. (Hart-Florida)

ANDREWS V VILLAGE OF GEORGETOWN (RESPONSIBILITY OF MUNICIPAL CORPORATION TO PREVENT FLOODS CAUSED BY STREET CONSTRUCTION).
34 Ohio App 79, 170 NE 450-451 (1929).

Descriptors: *Ohio, *Surface drainage, *Surface runoff, *Road construction, Road design, Roads, Surface water, Judicial decisions, Damages, Legal aspects, Floods, Flood damage, Real property, Cities.

Plaintiff landowner sought injunctive relief and incidental damages against defendant municipal corporation for surface water damage to plaintiff's residence, located within defendant's corporate limits. Flooding of plaintiff's property undisputedly resulted from reconstruction of a street abutting plaintiff's property. Defendant contended that, since the gravamen of plaintiff's case was that the reconstructed road was too high to permit drainage of surface water, defendant was not liable because the grade was fixed, the work sone, and the cost of the reconstruction paid by the state. The Court of Appeals of Ohio held that municipal corporations were responsible, under an Ohio statute, for keeping streets within their corporate limits free from nuisance, and thus affirmed the granting of an injunction against defendant. Since it appeard to the court that repairs already made by defendant would elimate future floods of plaintiff's property, the court assessed damages only for prior losses, and not for the reduction in value of plaintiff's property subject to the hazards of flood. (Madsen-Florida)

ANGLIM V CITY OF BROCKTON (MUNICIPAL LIABILITY FOR PROPERTY DAMAGES DUE TO RIVER OVERFLOW).
179 NE 289-294 (Mass 1932).

Descriptors: *Massachusetts, *Cities, *Drainage systems, *Flood damage, Stream improvement, Non-navigable waters, Streams, Dredging, Channel improvement, Stream stabilization, Surface drainage, Drainage effects, Damages, Riparian rights, Storm runoff, Sewage, Sewage disposal, Legislation, Statutes, Legal aspects, Judicial decisions.

A statute authorized defendant city to improve surface drainage by improving the flow of streams within the city limits. Defendant, acting through its highway commissioners,who were public officers, employed an independent contractor to widen, deepen, and straighten natural streams. Plaintiff landowner sought: (1) to restrain defendant from discharging refuse and sewage into a nonnavigable stream that flowed over his property nad (2) damages resulting from a runoff of sewage beyond the stream's channel during an unusual freshet. The Supreme Judicial Court of Massachusetts denied relief, holding that: (1) in the absence of a statute defendant would not be liable for the negligence of the commissioners performing public duties; (2) defendant was not liable when public officers diverted water from streets into a stream that overflowed plaintiff's property; (3) plaintiff's exclusive remedy for injury resulting from materials deposited upon his land was that specified in the statute and not a bill in equity; and (4) as to the sewage, it was deposited as a result of unusual weather and not from defendant's negligent construction or use of the sewers. COMPREHENSIVE WATER RESOURCES MANAGEMENT - THE PAST AND THE FUTURE,
Department of the Interior, Washington, D.C.
A. Gordon Everett.
Water Resources Bulletin, Vol 7, No 1, p 185-188, Feb 1971.

Descriptors: *Water resources development, *Institutional constraints, *Project planning, *Decision making, Administration.
Identifiers: Colorado River Basin, Water Resources Planning Act of 1965, Water Resources Council, Environmental Protection Agency.

American water problems have historically been characterized by the artificial separation of water quality and water quantity, and ignoring water economics. Our water affluence has allowed us to misuse them. Many agencies are affilitated with water resources management, yet only two have significant programs dealing with both quality and quantity. The whole system is poorly organized for all agencies depend on others in accomplishing their missions. (Campbell-Rutgers)

TURNER V PIERSON-HOLLOWELL WALNUT CO (OWNERSHIP OF LAND TO THREAD OF STREAM).

260 Ill App 158-166 (1931).

Descriptors: *Illinois, *Boundary disputes, *Ownership of beds, *Non-navigable waters, Legal aspects, Judicial decisions, Boundaries (Property), Rivers, Beds under water, River beds, Beds, Freshwater, Bodies of water, Trees, Land, Real property.

Plaintiffs and their children owned a tract of land which was bordered on one side by a non-navigable river. Plaintiffs brought an action in replevin to recover six walnut logs which were taken by defendant from a large tree that had been lying in the bed of the river. The tree had lain with its large end about three feet from the land allegedly owned by plaintiffs and with the trunk in the river. The Appellate Court of Illinois held that unless the deed clearly specified otherwise, a deed of land bordered by a river also carried with it the title of the grantor in the bed of the river to the center thread of the current and that the boundary would vary as the main channel changed. Plaintiffs' deeds did not mention what portion of the river was the boundary line. The court found that there was sufficient evidence to support the finding of the trial court that plaintiffs did own the land on which the tree was taken and were hence entitled to replevy the logs. (Johnson-Florida)

TENNESSEE ELECTRIC POWER CO V DODSON (OBSTRUCTION OF GROUNDWATER FLOW).
14 Tenn App 54-62 (1931).

Descriptors: *Tennessee, *Percolating waters, *Surface-groundwater relationships, *Underground streams, Groundwater, Fresh water, Groundwater movement, Sinks, Groundwater barriers, Springs, Legal aspects, Judicial decisions, Streams, Floods, Streamflow, Water injury, Dams, Backwater, Subsurface runoff.

A stream flowed across plaintiff's land and emptied into several sinkholes. It was not known where the subterranean passages from the sinkholes lay, but the water had been traced to four springs. Two of the springs were below the level of the pool created by defendant power company's dam, while two were above the pool level. Plaintiff sued to recover for damages to his land which occurred when the discharge of water from the sinkholes was obstructed and the stream backed up and flooded his land. Plaintiff alleged that defendant's dam had caused the obstruction by blocking the normal flow of the water which left the sinkholes. The Tennessee Court of Appeals reversed a judgment for plaintiff. The presumption is that groundwater is percolating. Proof is required to show that the water flows in a well defined stream before the groundwater will be considered to be an underground stream. If water does flow in an underwater stream, the lower owner has no right to obstruct the flow so that it floods the lands of the upper owners. The court held that plaintiff had failed to show that the water flowed in an underground stream or that defendant had caused the flooding. (Johnson-Florida)

Most of the states in the United States have fine planning units but lack the management of the implementation of planning, the staffs tend to become understaffed and under funded. Thus, the integration of the various plans is hampered or lost. The piece shows two separate alternative solutions, a single state resources agency or a central group of heads of agencies for coordination. (Campbell-Rutgers)

PATTERNS OF POLITICS IN WATER RESOURCES DEVELOPMENT,
National Water Commission, Arlington, Va.
Helen Ingram.
Natural Resources Journal, Vol 11, No 1, p 102-118, Jan 1971. 28 ref.

Descriptors: *Water resources development, Cost-benefit analysis, Political aspects.
Identifiers: *Central Arizona Project, Colorado River Basin Bill, Water Resources Council.

The author describes the present patterns that are used in adopting new water development projects in the United States. Even though cost-benefit analysis is used, it is easily twisted to gain support for one viewpoint, so that no overall discussion of who will benefit from the project is undertaken. A system of local pressure politics has emerged as the present pattern. (Holmes-Rutgers)

CONFERENCE REPORT ON HR 4148, WATER QUALITY IMPROVEMENT ACT OF 1970.

116 Cong Rec 2464 thru 2473 (daily ed Mar 25, 1970). 9 p.

Descriptors: *Water quality, *Water pollution sources, *Water pollution control, *Pollution abatement, Governments, Federal government, Legislation, Government finance, Permits, Administration, Abatement, Water pollution, Pollutants, Oil wastes, Industrial wastes, Chemical wastes, Environmental sanitation, Water pollution treatment, Waste water (Pollution), Acid mine water, Legal aspects.

According to this excerpt from the Congressional Record favorable comments were made by several representatives concerning the Water Quality Improvement Act of 1970. The conference report was accepted by a vote of 358 yeas, 0 nays, and 72 not voting. The conference report on the Act discussed: (1) the control of oil pollution, (2) cleanup authority, (3) limits of liability for oil spilled from vessels shipping oil, (4) limits of liability for on-shore and off-shore oil installations, (5) license requirements for use of the nation's waters, (6) a requirement for reasonable assurances that use of waters will not violate water pollution stan-

ards, (7) acid mine drainage research, (8) pollu-on control in the Great Lakes, (9) land acquisi-ons for field laboratories to study pollution, (10) il pollution removal research, (11) extension of ie basic existing research authorization, (12) evelopment of knowledge on the effects of pesti-des, and (13) a training program to provide ained personnel to operate sanitary facilities. oncern was expressed by certain House members the following areas: (1) possibility of delay due the complex system, (2) the meaning of the term easonable assurances', (3) whether the Act would pply to wholly intra-state water, and (4) cost of e Act. (Robinson-Florida)

ATER QUALITY STANDARDS (PROCEDURE OR REVISION).
nvironmental Protection Agency, Washington, C.

Federal Register, Vol 36, No 68, p 6762-6764 (Apr 8, 1971). 3 p.

Descriptors: *Water quality control, *Water pollution control, *Administrative decisions, *Conferences, Water quality, Water resources, Legal aspects, Federal government, State government, Administration, Administrative agencies, Regulation, Standards, Water pollution.
Identifiers: *Water Pollution Control Act.

Pursuant to the Federal Water Pollution Control Act the Administrator of the Environmental Protection Agency proposes new regulations concerning water quality standards. The Administrator or the governor of any state may seek to revise water quality standards. If the Administrator desires revisions he shall call a conference. If a governor wishes to revise water quality standards he shall request the Administrator to initiate a conference, and he shall submit the following: (1) a description of the location and nature of the interstate waters involved, standards to be revised, and the nature of the revision and reasons therefor; (2) a copy of the water quality standards with proposed deletions marked; (3) a summary of any public hearing held; and (4) an opinion by the State Attorney General that the proposed revisions have been adopted by the state if such is the case. The following areas relating to such a conference are detailed: (1) notice of conference; (2) service of notice; (3) parties; (4) organization and general procedures of the conference; (5) presentation of material; (6) conference procedure; (7) record of proceedings; and (8) preparation, publication, and promulgation of water quality standards. (Robinson-Florida)
W71-09434

SALINE WATER CONVERSION ACT OF 1971 (A BILL TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONTINUE RESEARCH AND DEVELOPMENT FOR THE TREATMENT OF SALINE AND OTHER CHEMICALLY CONTAMINATED WASTE WATER TO MAINTAIN OR IMPROVE THE QUALITY OF WATER).

Senate Bill 991, 92d Cong, 1st Sess (1971). 12 p.

Descriptors: *Desalination processes, *Waste water treatment, *Water quality control, *Desalination, Desalination plants, Water quality, Water sources, Water supply, Water resources, Water resources development, Water pollution, Water pollution treatment, Water purification, Water treatment, Byproducts, Desalination apparatus, Water reuse, Grants, Research and development, Federal government, State governments, Administration, Administrative agencies.

Under this proposed legislation the Secretary of the Interior would be authorized to: (1) conduct and promote research to develop processes for the conversion of saline water, (2) pursue opportunities arising during research, (3) conduct engineering and technical work, (4) study methods for the marketing of byproducts, and (5) undertake economic studies. The Secretary would also: (1) explore potential cooperative agreements with non-federal governmental entities, (2) recommend the earliest opportunity for the construction of desalting plants, (3) utilize the expertise of other federal agencies, and (4) accept financial or other assistance from any state or public agency. In carrying out his functions the Secretary may: (1) make grants to educational and scientific organizations; (2) acquire services of required types of personnel; (3) utilize federal laboratories; (4) establish necessary facilities; (5) acquire secret processes, technical data, inventions, patents, licenses, land and plants; (6) gather scientific literature; (7) conduct on-site inspections; (8) foster and participate in conferences; (9) coordinate, correlate, and publish information; and (10) cooperate with other federal departments, with state and local departments, and with interested persons. All research will be conducted so that the developments will be available to the general public. Nothing in this bill would alter existing law as to ownership and control of water. (Robinson-Florida)
W71-09435

A BILL TO REQUIRE THE SECRETARY OF THE ARMY, ACTING THROUGH THE CHIEF OF ENGINEERS, TO ENGAGE IN PUBLIC WORKS FOR THE PREVENTION AND CONTROL OF WATER POLLUTION.
Senate Bill 1009, 92d Cong, 1st Sess (1971). 2 p.

Descriptors: *Water pollution control, *Sanitary engineering, *Sewage treatment, *Waste water treatment, Water pollution, Pollution abatement, Pollutants, Federal government, Projects, Water pollution sources, Sewage, Wastes, Environmental sanitation, Sewage disposal, Storm runoff, Waste water disposal, Waste water (Pollution), Waste treatment, Water purification, Water treatment, Research and development, Construction, Dredging.

This proposed legislation would provide that the Secretary of the Army, acting through the Chief of Engineers, is authorized and directed to undertake, in the civil works program, projects for research, development, demonstration, and construction (including dredging) of works for the collection, purification, storage, and reuse of storm waters, sewage, and water-borne waste, for the purpose of preventing, abating, and controlling water pollution. Those projects shall have priority which reflect the most favorable ratio of environmental benefits to costs. Projects authorized by this bill would be subject to all the applicable provisions of law relating to flood-control projects, as determined by the Secretary of the Army. (Robinson-Florida)
W71-09436

CLEAN WATER COMMITMENT ACT OF 1971 (A BILL TO PROVIDE A NATIONAL COMMITMENT FOR FINANCING OF EXPANDED PROGRAMS UNDER THE FEDERAL WATER POLLUTION CONTROL ACT, TO ASSURE BETTER COORDINATION IN DEVELOPMENT OF CLEAN WATER PROGRAMS).
Senate Bill 1143, 92d Cong, 1st Sess (1971). 7 p.

Descriptors: *Water pollution control, *Government finance, *Water quality, *Pollution abatement, Water pollution, Water quality control, Administrative agencies, Federal government, State governments, Legislation, Legal aspects, Grants.

To provide a national commitment of $15 billion for financing of expanded programs under the Federal Water Pollution Control Act and for better coordination in development of clean water programs, this bill entitled the Clean Water Commitment Act of 1971 is proposed. In state determinations of project priority, primary emphasis must be placed upon effectiveness of individual projects in abating water pollution and improving water quality. Limitations of federal grants under the program are: (1) projects must be approved by the state water pollution agency and the Secretary, and must be included in a comprehensive plan; (2) enforceable water quality standards must be established for affected waters; (3) grants are limited to 75% of project cost; (4) grantees must agree to pay the remaining cost; (5) efficient operation and maintenance must be assured; and (6) projects must conform to state water pollution control plans. Seventy-five per cent of available funds are allocated to the state on a population basis; the remainder are designated for abatement of the most severe water pollution problems. An annual reporting and accounting to Congress is required. (Hart-Florida)
W71-09437

A BILL TO REGULATE THE DISCHARGE OF WASTES IN TERRITORIAL AND INTERNATIONAL WATERS UNTIL FIVE YEARS AFTER

THE ENACTMENT OF THE ACT AND TO PROHIBIT SUCH DISCHARGE THEREAFTER.
Senate Bill 1082, 92d Cong, 1st Sess (1971). 8 p.

Descriptors: *Permits, *Oceans, *Research and development, Continental shelf, Technology, Grants, Administrative agencies, Federal government, Ships, Legal aspects, Government finance, Ecology, Environment, Water pollution, Water pollution control, Water quality, Water quality control, Marine animals, Marine plants, *Waste disposal, Regulation, Waste dumps, Wastes.

Five years from enactment of this proposed legislation, discharge of wastes into territorial or international waters would be prohibited. In the interim period, discharge would be permitted only under permit from the Administrator of the Environmental Protection Agency. Permits would only be issued when the Administrator determined that marine ecology would not be harmed by the discharge. Furthermore, no permits would be issued for discharging sites between the continental shelf and the United States coast, and the Administrator would have authority to bar discharge of any specific matter deemed deleterious to the marine environment. Ocean dumping sites could be designated by the Administrator. Violation would be punished by civil fine. Additionally, the Administrator would conduct research and demonstration projects to determine methods of using and disposing of wastes normally dumped at sea. Private agencies as well as state and local governments would be encouraged and assisted by the federal government in conducting similar projects. Federal grants would be available for these activities. (Hart-Florida)

NUISANCE LAW AS AN ENVIRONMENTAL TOOL.
David G. Warren.
Wake Forest Law Review, Vol 7, No 2, p 211-229, 1971. 19 p, 110 ref.

Descriptors: *North Carolina, *Water pollution control, *Pollution abatement, *Public rights, Legal aspects, Water law, Water pollution, State governments, Local governments, Cities, Environment, Social aspects, Environmental sanitation, Public health, Water quality, Water quality control.

North Carolina recognizes actions of public and private nuisance. An historical background of nuisance law is provided. Forms of actions based on public nuisance, private nuisance, negligence, and tresspass are discussed and compared. Private and public remedies of damages, injunctive relief, and abatement by self-help are discussed. The effectiveness of nuisance as a tool of environmental control is examined with reference to the use of nuisance by municipalities, counties, and local boards of health. The author concludes that North Carolina's nuisance laws are uncertain and confused and feels that actions for public and private nuisance should be preserved by law, broadened in scope, clarified, and used more often. Nuisance has on occasion been successfully used for environmental control but may become ineffectual. The author, lists several possibilities: (1) return to common law approaches exclusively, (2) abolish all nuisance actions not based on specific laws, or (3) empower private citizens to bring nuisance actions on behalf of the state. The last possibility is favored. (Robinson-Florida)
W71-09442

RIVERS, LAKES, AND STREAMS--REGU LATION.
Public Act 76-2453, Illinois Legislative Service, p 579-581 (1970) amending Illinois Annotated Statutes ch 19, secs 61a, 65.

Descriptors: *Illinois, *Permits, *Lake Michigan, *Landfills, Legislation, Administration, Administrative decisions, Administrative agencies, Water pollution, Water pollution sources, Water pollution control, Water use, Water supply, Lakes, Streams, Rivers, Water quality, Water quality control, Pollution abatement, Legal aspects, Structures.

An Illinois statute concerning regulation of rivers, lakes, and streams is amended to provide for close cooperation between the Pollution Control Board, Environmental Protection Agency, Illinois Institute for Environmental Quality, and the Department of Public Works and Buildings, especially for preservation of Lake Michigan. The Environmental Protection Agency is directed to abate pollution of Lake Michigan and regularly conduct water quality surveys in it, making results available to all interested parties. Futhermor, the amendment makes landfills or construction in public waters unlawful absent a permit from the Department of Public Works and Buildings. Permits may not be issued for construction in Lake Michigan without concurrence by the Pollution Control Board. Violation of the statute is punishable by fine and imprisonment. Building of causeways, harbor, or mooring facilities in Lake Michigan must be approved by the legislature; structures erected in violation may be abated as purprestures. Permits may be granted by the Department of Public Works and Buildings for use of public water. Where a permit is sought for construction of land-fills in public waters, the Department shall require, as a condition precedent, approval by riparian owners affected by the structure. (Hart-Florida)
W71-09443

TAXATION-POLLUTION CONTROL FACILITIES.
Public Act 76-2451, Illinois Legislative Service, p 577-578 (1970) amending Illinois Annotated Statutes ch 120, sec 502a.

Descriptors: *Illinois, *Pollution abatement, *Taxes, *Administrative decisions, Administrative agencies, Air pollution, Water pollution, Water pollution control, Water quality, Water quality control, Legislation, Legal aspects, Treatment facilities.

The Illinois Revenue Act is amended to define 'pollution control facilities' as facilities operated for the primary purpose of controlling air or water pollution, as defined in the Environmental Protection Act, or for the primary purpose of treating substances which if released untreated would be deleterious to the environment. The Pollution Control Board shall certify pollution control facilities for tax purposes. Application for a pollution control facility certificate shall be filed with the Pollution Control Board, as required by its procedure, and the Board will issue a certificate to conforming facilities, which will receive preferred tax treatment for the period certified. Hearings must be provided before denial of certification. The Board may revoke certification on its own motion when: (1) fraud exists, (2) the certificate holder has substantially failed to proceed with operation of the facility, or (3) the facility has ceased to be used for pollution control. Written notice of the Board's action shall be furnished applicants. Any aggrieved applicant or holder may appeal pursuant to the Administrative Review Act. (Hart-Florida)
W71-09444

AN ACT IN REALTION TO PREVENTION AND ABATEMENT OF AIR, LAND AND WATER POLLUTION.
Public Act 76-2434, Illinois Legislative Service, p 557-558 (1970) amending Illinois Annotated Statutes ch 14, secs 11, 12.

Descriptors: *Illinois, *Pollution abatement, *Air pollution, *Water pollution, Legislation, Judicial decisions, Legal aspects, Water pollution control, Administrative agencies, Administrative decisions.

Definitions of the terms 'air pollution', 'water pollution', and 'land pollution' correspond to their respective definitions under the Environmental Protection Act, under this amendment to an Illinois Statute concerning abatement of air and water pollution. Furthermore, the Attorney General is empowered to prevent pollution by instituting proceedings in the circuit court of the county where the pollution is occurring. The court shall specify a time for answer, which shall be within 21 days of service of process, and issue an interim temporary restraining order. After default or answer, the court shall inquire into the alleged pollution and provide an appropriate order. Appeals from final orders are taken in the normal manner. The title of the Act is amended to read 'An Act in relation to the prevention and abatement of air, land and water pollution'. (Hart-Florida)
W71-09445

AN ACT TO CREATE SANITARY DISTRICTS IN CERTAIN LOCALITIES.
Public Act 76-2436, Illinois Legislative Service, p 558-559 (1970) amending Illinois Annotated Statutes ch 42, sec 260.

Descriptors: *Illinois, *Water districts, *Drainage, *Sewage disposal, Cities, Administrative agencies, Local governments, Public utilities, Treatment facilities, Streams, Legislation.

An Illinois statute concerning creation of sanitary districts for drainage and the disposal of sewage is amended to provide that the Board of Trustees shall have power to: (1) do everything necessary to establish waste treatment plants; (2) alter the course of, or enlarge, any watercourse and extend it into an incorporated area; (3) contract with the city for use of the treatment works by the city for reasonable compensation, with increased costs of its use to be paid by the city; (4) maintain the projects established; and (5) extend work beyond the limits of the district, provided that no taxes may be levied beyond the district, and the district shall be liable for damages incurred beyond its limits. (Hart-Florida)

GIBSON V CITY OF TAMPA (DISCHARGE OF MUNICIPAL SEWAGE INTO COASTAL WATERS).
154 So 842-843 (Fla 1934).

Descriptors: *Florida, *Municipal wastes, *Water pollution, *Pollution abatement, Sewage, Sewage disposal, Sewage treatment, Sewerage, Oysters, Shellfish, Cities, Domestic wastes, Water pollution sources, Waste treatment, Environmental sanitation, Impaired water quality, Pollutants, Treatment, Wastes, Water quality, Judicial decisions, Legal aspects, Remedies.

Plaintiff oyster grower sought to enjoin defendant city from discharging untreated sewage into coastal waters, to the detriment of plaintiff's oyster beds. The Supreme Court of Florida held plaintiff had not made a clear showing that equitable relief was justified, and thus affirmed the dismissal of plaintiff's bill of complaint. The court pointed out that the dismissal was without prejudice to plaintiff's rights, if any, to maintain an action at law to redress the alleged injury. (Madsen-Florida)

REUSS V MOSS-AMERICAN, INC (AUTHORITY FOR CITIZEN TO BRING QUI TAM ACTION FOR VIOLATION OF RIVERS AND HARBORS ACT).
123 F Supp 848-850 (ED Wis 1971).

Descriptors: *Rivers and Harbors Act, *Wisconsin, *Federal government, *Water pollution, Water pollution control, Water pollution sources, Water quality, Water quality control, Navigable waters, Legislation, Administrative decisions, Legal aspects, Judicial decisions.

Plaintiff citizen filed an action against defendant corporation for violation of the Rivers and Harbors Act. Defendant moved to dismiss, contending that only the Department of Justice can bring proceedings for violation of the Act. 33 U.S.C. Section 413 provides that the Justice Department shall conduct the legal proceedings necessary to enforce the provisions of section 407. Plaintiff based his action for violation of section 407 upon section 411, which provides for payment of part of the assessed fine to the person giving information which shall lead to conviction under section 407. Plaintiff contended that an informer may proceed with a civil action if the government fails to prosecute when a statutory reward is available. The United States District Court for the Eastern District of Wisconsin, however, found no implied right to bring a qui tam action under the Rivers and Harbors Act, because of the express provision for prosecution by the Department of Justice. Hence, defendant's motion to dismiss was granted. (Hart-Florida)
W71-09448

STATE V SLOTNESS (TRUST DOCTRINE LIMITED TO WATER-CONNECTED PURPOSES).
185 NW 2d 530-534 (Minn 1971).

Descriptors: *Minnesota, *Lake Superior, Ownership of beds, *Condemnation, Riparian land, Lake beds, Relative rights, Project purposes, Artificial use, Earth fill, Legal aspects, Judicial decisions, Eminent domain, Navigation.

Defendant riparian landowner had by landfill created new dry land extending from the low water mark of his upland property to the point of navigability of Lake Superior. Plaintiff state sought to condemn this fill land without payment of compensation to defendant. Plaintiff sought a declaratory judgment regarding compensation, claiming that, since the bed of the lake was held in trust for the people, defendant only held the filled portion of land as a tenant at sufferance. This claim postulated that one purpose of the trust doctrine was the holding of the lake bed for a public highway. Defendant contended that his rights in the filled land were limited only by the public right in exclusively water connected uses. The Minnesota Supreme Court, holding for defendant, declared that construction of a public highway was strictly a land use and not remotely connected with navigation or any other water connected public use. Compensation must be paid in such cases unless the condemnation is solely in aid of navigation. (Kohla-Florida)

THE COSSATOT RIVER --- ANOTHER LEGAL MILESTONE,
Don G. Cullimore.
American Forests, Vol. 77, No. 5, p. 8-10, May 1971, 61, 2 figures.

Descriptors: *Cost-benefit analysis, *Legal aspects, *Institutional constraints.
Identifiers: *Cossatot River, Arkansas, National Environmental Policy Act.

The author describes a landmark decision by a U.S. District Court judge in Arkansas forbidding construction of a dam across the Cossatot River in Arkansas because of noncompliance with the National Environmental Policy Act of 1969. Although ten million dollars had already been spent on the project, the author explains that the dam itself had not been contracted for. The controversy centered around the definition of costs and benefits of the project. (Holmes-Rutgers)

INTEGRATED RESOURCE MANAGEMENT,
I. W. Varty.
The Forestry Chronicle, Vol. 47, No. 1, p. 19-21, Feb. 1971, 8 references.

Descriptors: *Resource allocation, *Project planning, *Social aspects, *Political aspects.
Identifiers: *Canada, Canadian Water Act, Canadian Arctic.

This article is a summation of views expressed at the Acadian Entomological Society Symposium held September 2, 1970, at the University of New Brunswick on the entomologist's role in integrated resource management. The participants stressed the need for long range planning, adherence to well defined goals, and better coordination of bodies regulating the legislation on pollution as well as more ecological research on the effects of pollutants. (Holmes-Rutgers)

WHAT'S HAPPENING TO OUR SALT WATER MARSHES,
New York State Dept. of Environmental Conservation, Albany. Div. of Marine and Coastal Resources.
John J. Spagnoli.
The Conservationist, Vol. 25, No. 5, p. 22-27, April-May 1971, 2 figures, 9 ref.

Descriptors: *Marsh management, *Plant ecology, *Salt marshes.

The author describes the characteristics and benefits of salt marshes, explaining the natural as well as unnatural successions that take place. He details the effects of environmental pollutants on the salt marshes and repeats the arguments in favor of salt marsh protection. He cites particularly Dr. Odum's measurements of high annual production of dry matter in salt marshes because of their ability to fix organic matter from sunlight. (Holmes-Rutgers)
W71-09410

TURNABOUT ON THE CHATTOOGA,
Don G. Cullimore.
American Forests, Vol. 77, No. 2, p. 12-15, Feb. 1971, 55, 56, 2 figures.

Descriptors: *Water resource development, *Environmental effects, Cost-benefit analysis.
Identifiers: Chattooga River, Wild and Scenic Rivers Act.

The story of how and why the four dams on the Chattooga River in northeastern Georgia were not constructed by the U.S. Army Corps of Engineers is described in this article. In contrast to previous situations, where the author explains that the corps has decided to build or not to build dams on the basis of construction costs and economic returns, in this case the decision was made on the basis of environmental concerns. Even though the construction of the four dams had been approved by congress, the river was declared a wild and scenic river and therefore not to be dammed up. (Holmes-Rutgers)

07. RESOURCES DATA

7A. Network Design

A PROPOSED STREAMFLOW DATA PROGRAM FOR TEXAS,
Geological Survey, Austin, Tex.
C. R. Gilbert, and R. O. Hawkinson.

Geological Survey Open-file Report (Texas Dist No 126), Mar 1971. 52 p, 3 fig, 1 plate, 5 tab, 11 ref.

Descriptors: *Streamflow, *Data collections, *Network design, *Texas, Reviews, Evaluation, Programs, Project planning, Stream gages, Hydrologic data, Gaging stations, Regression analysis, Reservoirs, Surface waters, Natural flow, Regulated flow, Discharge measurement, Flow rates, Flow characteristics, Streamflow forecasting.

An evaluation of the streamflow data available in Texas was made to provide guidelines for planning future programs. The basic steps in the evaluation procedure were: (1) Definition of the long-term goals of the streamflow-data program in quantitative form; (2) examination and analysis of all available data to determine which goals have already been met; and (3) consideration of alternative programs and techniques to meet the remaining objectives. Although the present natural-streams data program in the eastern two-thirds of the State was found to be adequate, data collection in the regulated-streams systems is deficient. Data collection is needed to define the inflow-outflow characteristics at eight additional reservoirs on minor streams. Additionally, gaging of outflow is needed at six reservoirs on minor streams and at five reservoirs on principal streams where reservoir-contents data are presently collected. One additional gaging station is needed to monitor outflow from systems of floodwater-retarding reservoirs in the Trinity River basin south of Dallas. (Woodard-USGS)

A PROPOSED STREAMFLOW DATA PROGRAM FOR UTAH,
Geological Survey, Salt Lake City, Utah.
G. L. Whitaker.
Geological Survey Open-file Report, 1971. 46 p, 4 fig, 4 tab, 14 ref, append.

Descriptors: *Streamflow, *Project planning, *Network design, *Data collections, *Utah, Hydrologic data, Reviews, Evaluation, Stream gages, Flow characteristics, Water yield, Water resources development, Gaging stations, Regression analysis.
Identifiers: Streamflow characteristics, (Utah), Basin characteristics, Program planning.

The streamflow data available for Utah are evaluated and guidelines for planning future programs are presented. The portions of the Bear River basin in Wyoming and Idaho were included in the Utah report. Records for 98 gaging stations, which were representative of natural flow, were analyzed for statistical characteristics. Twelve drainage-basin characteristics were compiled for each station. Multiple-regression analyses were performed by electronic computer to relate streamflow characteristics to basin characteristics. The streamflow characteristics for ungaged sites in Utah could not be defined accurately enough by regression methods. The goals for current-purpose data are being met. Several existing sites were recommended as long-term trend stations. Programs for collecting data on stream environment are proposed. Also a network of gaging stations and alternate methods for achieving the goals for streamflow characteristics at ungaged sites are proposed. (Woodard-USGS)

J. C. Schuster, and R. L. Hansen.
Paper American Society of Civil Engineers National Water Resources Engineers Phoenix, Ariz, Jan, 1971. 18 p, 4 fig, 1 tab. 6 ref, append.

Descriptors: *Discharge measurement, *Hydraulic turbines, Pipelines, *Radioisotopes, Research and development, Experimental data, Tracers, *Flow measurement, Accuracy, Fluid mechanics, Field tests, Laboratory tests, Radiation measuring equipment, Colorado.
Identifiers: Pole Hill Powerplant (Colo), Dilution method.

During 1965 to 1970, the Atomic Energy Commission and Bureau of Reclamation cooperated in a research program for measuring discharge through high-head turbines and pumps using radioisotopes. Purpose of the research was to develop a method for making discharge measurements accurately, quickly, and with a minimum of personnel and equipment. Measurements were made on the Flatiron Power and Pumping Plant penstock to compare the relative accuracy of using the radioisotope-velocity, integrated sample, dilution, and total-count methods. Measuring equipment was installed at the Pole Hill Powerplant for measuring turbine discharge at the single-unit plant. Results indicated no superiority of any of the 3 methods used to measure the discharge radioisotope. Discharge measurements showed consistent results with an accuracy of plus or minus 1.5%. General observations are given for all 4 radioisotope measurement methods. (USBR)

THE DEVELOPMENT OF A WIDE RANGE IMAGE SPECTRO PHOTOMETER INFORMATION SYSTEM,
TRW Systems Group Redondo Beach, Calif.
Keith P. Jenkin, and Richard C. Ramsey.
Available from the National Technical Information Service as AD-721 385, $3.00 in paper copy, $0.95 in microfiche. Naval Oceanographic Office Contract Report, 25 Feb 71. 101 p.

Descriptors: *Water pollution, *Remote sensing, *Oil wastes, *Spectro photometry, Computers, Data storage and retrieval.
Identifiers: *Data processing systems, Airborne, *Ocean surveillance, Spectra Visible .. ultraviolet, Analog-to-digital converters, Computer storage devices, Display systems, Sensors, Spectrum signatures, WISP Widerange image spectrophotometers, *Management information systems, Oil slicks, Oil pollution.

A data handling system was developed for WISP data. The procedure for the reduction of the raw flight data to graphic displays were refined in the program. Computed-generated maps are presented which enhance the various scene features and these are based upon the selection of the appropriate algorithms to fit the scene information. Polarization measurements of the airlight directed upward over the oceans were obtained up to 10,000 feet altitudes. The high values of polarization obtained suggest a significant gain in signal contrast will result from use of polarizers in spacecraft ocean color sensors. Low altitude spectrometer flights over sewage outfalls and 'red tide' resulted in good correlation between the visible spectral nature of the upwelling light and ground truth turbidity and organisms counts. Useful algorithms were developed to best characterize the nature of the spectral data and the existing types of water pollution. Spectrometer measurements of a liberate oil spillage on the ocean indicated no visible signatures were present.

NIMBUS WEATHER SATELLITES: REMOTE SOUNDING OF THE ATMOSPHERE,
Gerald L. Wick.
Science, Vol 172, No 3989, p 1222-1223, June 18, 1971. 2 p, 5 ref.

Descriptors: *Weather data, *Satellites (Artificial), *Remote sensing, *Weather forecasting, *Atmospheric physics, Meteorological data, Application methods, Water vapor, Infrared radiation, Air temperature, Research and development, Instrumentation.
Identifiers: *Weather satellites (Nimbus), *Mapping (Weather).

Since inception in 1959 weather satellites have made a vast impact on the science of meteorology. From cameras in orbit cloud pictures and air movements could be determined--now a standard feature of weather forecasting--and infrared maps were made that show temperature variations. Instruments aboard Nimbus 3 (1969) and Nimbus 4 (1970) can now yield the vertical profile of air temperature between earth and the satellites. Global distribution of ozone and water vapor can also be measured. Carbon dioxide and temperature measurements techniques are described; and problems,

uch as cloud cover that obscures radiation from he earth's surface, are discussed. Constant surveil-ance by Nimbus of global temperature patterns rovides a unique opportunity to analyze known veather patterns and to spot previously unknown henomena. It was found, for example, that the 970 winter South Pole had two district cold re-ions at 45 Km where only one was expected. A ritish team and others observed 'sudden varmings' in the stratosphere over the winter lorth Pole where temperature over small areas ay rise as much as 50 deg K in a few days. One ear's highly successful operation in remote sound-ng of the atmosphere indicates an increasingly im-ortant source of data for meteorologists and thers for the future. (Lang-USGS)

/ALUATING GEOLOGIC HAZARDS WITH ULTIBAND PHOTOGRAPHY,
n Francisco State Coll., Calif. Dept. of Geology.
aymond Pestrong.
Journal of Remote Sensing, Vol 2, No 2, p 4-9, Apr-May 1971. 6 p, 1 fig, 4 photo.

Descriptors: *Remote sensing, *Cameras, *Aerial photography, *Terrain analysis, Hydrology, Watersheds (Basins), Surface waters, Topography, Vegetation, Methodology, Geology, Groundwater.
Identifiers: Drainage areas, Hydrologic regime.

A simple, effective multiband photographic system may be constructed from four synchronized 35 mm cameras, utilizing panchromatic black and white infrared, Kodachrome, and Ektachrome infrared films plus the appropriate filters. Such a system minimizes spectral duplication and provides unique photographic signatures for a variety of terrain features of interest to the land planner. All of the required films are readily available in 20-exposure 35 mm formats, thereby, facilitating utilization of the system with a minimum of specialized equipment. This type of analysis has been especially useful in the delineation of landforms along the margins of the San Francisco Bay, as well as for the location of large landslides in the nearby coast ranges. As the landslides disrupt drainage and vegetation, they show up most clearly on the Ektachrome infrared photographs. (Woodard-USGS)

SELF-OPERATED PIPETTE FOR GRAIN-SIZE ANALYSIS: A PROTOTYPE,
Florence Univ. (Italy). Inst. of Geology.
Carlo Bartolini.
Sedimentology, Vol 14, No 3/4, p 295-308, July 1970. 14 p, 12 fig, 11 ref.

Descriptors: *Silts, *Analytical techniques, *Particle size, *Settling velocity, *Automation, Suspension, Velocity, Mineralogy, Sedimentology, Sedimentation rates.
Identifiers: *Particle size analysis.

A self-operated pipette analyzes the silt fraction of a sample at half-phi intervals. Operator assistance is only required during the first four minutes of analysis. The procedure allows working three samples at a time twice a day. With a reduced height of fall nine samples could be easily treated in a working day. The total working time of the operator for the complete analysis of one sample (starting with already dispersed sample and including the weighing of the subsamples and the washing of the beakers) is about 30 min. ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR NORTH CREEK, TRINITY RIVER BASIN, TEXAS - 1969,
Geological Survey, Austin, Tex.
C. C. Kidwell.
Geological Survey Data Report, 1970. 32 p, 2 fig, 3 tab.

Descriptors: *Surface waters, *Hydrologic data, *Data collections, *Texas, *Rainfall-runoff relationships, Floods, Storms, Flood control, Stream gages, Discharge measurement, Flow rates, Water quality, Chemical analysis, Meteorological data, Hydrographs, Mass curves, Small watersheds.
Identifiers: *North Creek (Tex), Trinity River basin (Tex), Floodwalls

This report contains rainfall and runoff data for the 1969 water year for the 21.6-square-mile area above the stream-gaging station North Creek near Jacksboro, Texas. The location of proposed flood-water-retarding structures and hydrologic instruments are shown. The average rainfall during the 1969 water year was 32.94 inches, which is greater than the 12-year (1957-69) average of 31.02.

Monthly rainfall totals ranged from 0.67 inch in January to 5.51 inches in May. Rainfall was scattered throughout the year with every month receiving some rainfall. The mean daily discharge at the stream-gaging station was 4.71 cfs, compared with the 13-year average of 5.98 cfs. The annual runoff was 3,410 acre-feet, or 2.96 inches. Computations include detailed time breakdown of rainfall and discharge. Hydrographs and mass curves are drawn for illustration. Two chemical-quality samples were collected for analysis at the stream-gaging station North Creek near Jacksboro, Texas. The results of the chemical analyses are given. The water contained calcium and bicarbonate as the predominant ions. (Woodard-USGS)
W71-09080

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA AND MUKEWATER CREEK, COLORADO RIVER BASIN, TEXAS, 1969,
Geological Survey, Austin, Tex. Water Resources Div.
H. H. Hejl, Jr.
Geological Survey Data Report, 1970. 84 p, 2 fig, 3 tab.

Descriptors: *Streamflow, *Rainfall-runoff relationships, *Hydrologic data, *Data collections, *Texas, Small watersheds, Flow measurement, Stream gages, Runoff, Flow rates, Flow characteristics, Storms, Watershed management, Flood protection, Hydrographs, Mass curves, Reservoirs, Water storage, Water yield, Average flow.
Identifiers: *Mukewater Creek (Tex), Runoff computations, Flood-retarding structures, Water budget.

This report contains the rainfall, runoff, and storage data collected during the 1969 water year for the 70.0-square-mile area above the stream-gaging station Mukewater Creek at Trickham, Texas. All six of the floodwater-retarding structures in the Muke water Creek watershed are upstream from the stream-gaging station. The structures have a combined capacity of 5,790 acre-feet and control an area of 27.6 square miles, or 39% of the drainage area. The weighted-mean rainfall for the 1969 water year was 27.76 inches, or almost 114% of the 17-year (1953-1969) average of 24.45 inches. Monthly rainfall ranged from 0.04 inch in October to 4.96 inches in September. Mean daily discharge at the stream-gaging station was 3.91 cfs, compared with the 18-year average of 11.2 cfs. Annual runoff at the stream-gaging station was 2,830 acre-feet, or 0.76 inch. Three storms were selected for detailed computation including detailed time breakdown of rainfall and discharge. Hydrographs and mass curves are drawn for illustrations. (Woodard-USGS)
W71-09083

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR CALAVERAS CREEK, SAN ANTONIO RIVER BASIN, TEXAS, 1969,
Geological Survey, Austin, Tex. Water Resources Div.
J. M. Alexander.
Geological Survey Data Report, 1970. 56 p, 2 fig, 3 tab.

Descriptors: *Streamflow, *Rainfall-runoff relationships, *Hydrologic data, *Data collections, *Texas, Average flow, Small watersheds, Flow measurement, Stream gages, Runoff, Flow rates, Flow characteristics, Storms, Watershed management, Hydrographs, Mass curves, Reservoirs, Flood control, Water storage, Water yield.
Identifiers: *Calaveras Creek (Tex), Flood-retarding structures, Runoff computations.

This report contains the rainfall, runoff, and storage data collected during the 1969 water year for the 77.2 - square - mile area above the stream-gaging station Calaveras Creek near Elmendorf, Texas. There are seven floodwater-retarding structures in the Calaveras Creek watershed. These structures have a capacity for temporary storage of 8,640 acre-feet of flood runoff from 26.6 of the 77.2 - square-mile study area. All but one of the structures are upstream from Calaveras Lake. The mean rainfall for the 1969 water year was 30.91 inches, or 112% of the 14 year (1955-68) weighted-mean average. The average monthly-rainfall totals ranged from 0.42 inch in July to 6.02 inches in November. Mean daily discharge at the stream-gaging station, Calaveras Creek near Elmendorf, was 1.16 cfs. This shows the effect of Calaveras Dam on the basin as the average discharge for the preceding 14 years was 10.7 cfs. Annual runoff at the stream-gaging station was 839 acre-feet, or 0.20 inch. Three storms were selected for detailed computations including detailed time breakdown of rainfall and discharge. Hydrographs and mass curves are drawn for illustrations. (Woodard-USGS)
W71-09084

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1969,
Geological Survey, Austin, Tex., Water Resources Div.
W. D. Robbins.
Copies of report may be obtained at US Geological Survey, Water Resources Div, Federal Bldg, 300 E8th St, Austin, Tex, 78701. Geological Survey Data Report, 1970. 46 p, 3 fig, 1 tab.

Descriptors: *Rainfall-runoff relationships, *Urbanization, *Cities, *Hydrologic data, *Texas, Data collections, Small watersheds, Watershed management, Streamflow, Flow measurements, Flow rates, Average flow, Runoff, Storms, Storm drains, Hydrographs, Mass curves, Water yield, Peak discharge.
Identifiers: *Urban hydrology, *Austin (Tex).

Rainfall and runoff data are presented for the Waller Creek and Wilbarger Creek study areas for the 1969 water year. The Waller Creek drainage area lies entirely within the city of Austin, with the headwaters originating in the northern part of the city. The creek flows south for 6.6 miles to the Colorado River. Storm sewers and street gutters divert runoff both into and out of the natural drainage area. The weighted-mean rainfall upstream from 38th Street was 30.25 inches, 7% below the mean annual rainfall for Austin of 32.58 inches. Mean daily discharge was 1.38 cfs; annual runoff was 8.08 inches, or 27% of rainfall. The headwaters of Wilbarger Creek originate in Travis County near the Williamson County line. The creek flows southeasterly about 40 miles to the Colorado River. The Wilbarger Creek study area is about 15 miles north of the city of Austin. Weighted-mean rainfall in this study area was 27.92 inches, 14% below the mean annual rainfall for Austin. Mean daily discharge was 1.49 cfs; annual runoff was 4.40 inches, or 16% of the rainfall. (Woodard-USGS)
W71-09086

PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
Geological Survey, Jackson, Miss.
J. A. Callahan.
Mississippi Board of Water Commissioners Bulletin 71-1, 1971. 61 p, 5 fig, 10 ref.

Descriptors: *Water supply, *Industrial water, *Domestic water, *Water resources development, *Mississippi, Groundwater, Surface waters, Water yield, Water quality, Aquifer characteristics, Hydrologic data, Data collections, Public utilities, Water utilization, Pumping, Water storage, Chemical analysis, Withdrawal, Water wells, Water levels, Rivers.
Identifiers: *Public water supply, *Industrial water supply.

Data on the public and industrial water supplies of 37 counties in southern Mississippi are presented. Information for each public-supply system includes population served, average daily pumpage, storage, treatment, well descriptions, and chemical analyses if available. Estimated self-supplied industrial water use is given for each county, and industrial-supply wells are described. Total public- and industrial-supply pumpage in 1970 amounted to 1,300 mgd. Of the 1,090 mgd pumped from surface-water sources, 540 mgd were brackish water from Back Bay of Biloxi and the Pascagoula River estuary. All public water supplies except those at Jackson and Meridian are obtained from aquifers of Eocene age and younger. Although the greater number of industrial supplies are obtained from Miocene aquifers most of the water pumped for industrial use is from surface sources. (Woodard-USGS)

GROUNDWATER DATA AS OF 1967--COLORADO DESERT SUBREGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
J. S. Bader.
Geological Survey Open-file Report, Mar 5, 1969. 19 p, 1 fig, 50 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Reviews, Water table, Water levels, Water yield, Specific capacity, Withdrawal, Pumping, Groundwater recharge, Water temperature, Water quality, Chemical analysis, Dissolved solids, Aquifers, Hydrogeology, Water resources development.
Identifiers: *Groundwater resources.

Most usable groundwater in the Colorado Desert Subregion occurs in the alluvium-filled valleys that occupy about half the subregion. The alluvium consists generally of lenticular beds of unconsolidated to semiconsolidated clay, silt, sand, and gravel of Cenozoic age. The intervening mountainous areas are underlain by consolidated sedimentary, igneous, and metamorphic rocks, mainly of Mesozoic age or older. These rocks contain only small quantities of recoverable groundwater. Total storage capacity of the 45 basins is nearly 158,000,000 acre-feet. The usable storage capacity has been determined only for Coachella Valley where it is 3,600,000 acre-feet. Groundwater temperature ranges from about 60 deg to about 90 deg F, but temperatures of more than 500 deg F have been observed locally. The dissolved solids content of the water varies greatly (from less than 600 to more than 300,000 parts per million), depending on local conditions. The predominant water type is sodium sulfate or sodium chloride. Properly constructed wells in some areas can yield as much as 3,900 gallons per minute. (Woodard-USGS)

dentifiers: *Groundwater resources.

lost usable groundwater in the predominantly ountainous North Coastal Subregion occurs in idely scattered alluvium-filled valleys and coastal ains. The alluvium consists generally of lenticular eds of unconsolidated to semiconsolidated clay, lt, sand, and gravel of Cenozoic age. The interening mountainous areas are underlain by conlidated sedimentary, igneous, and metamorphic cks mainly of Mesozoic age or older. These older cks contain only small quantities of recoverable oundwater. Total storage capacity of the 13 asins for which determinations have been made is early 1,000,000 acre-feet. The usable storage apacity is 700,000 acre-feet; the limiting factors e the possibility of sea-water intrusion and quifer materials of low permeability. Groundwater mperature ranges from about 50 deg to about 70 eg F, but locally is as low as 43 deg and as high as 78 deg F. The dissolved-solids content of the ater is generally less than 500 parts per million, it locally is more than 4,800 parts per million. he predominate water type is calcium bicarbnate. Properly constructed wells in some areas n yield as much as 4,000 gallons per minute. Woodard-USGS)

Identifiers: *Groundwater resources.

Most usable groundwater in the predominantly mountainous North Lahontan Subregion occurs in scattered valleys that are filled with alluvium and material of volcanic origin. The intervening mountainous areas are underlain mainly by igneous rocks of Mesozoic and Cenozoic age. These rocks contain only small quantities of recoverable groundwater. Total storage capacity of seven of the eight basins is nearly 23 million acre-feet. However, the usable storage capacity has not been determined; the limiting factor is the quality of the water. Groundwater temperature ranges from about 50 deg to about 80 deg F, but locally is as high as 182 deg F. The dissolved-solids content of the water is generally less than 500 parts per million, but locally is as much as 2,030 ppm. The predominant water type is calcium bicarbonate. Properly constructed wells in some areas can yield as much as 3,800 gallons per minute. (Woodard-USGS)

GROUNDWATER DATA AS OF 1967--SAN JOAQUIN BASIN SUBREGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. S. Bader.
Geological Survey Open-file Report, Mar 5, 1969. 16 p, 1 fig, 112 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Reviews, Water table, Water levels, Water yield, Specific capacity, Withdrawal, Pumping, Groundwater recharge, Water temperature, Water quality, Chemical analysis, Dissolved solids, Aquifers, Hydrogeology, Water resources development.
Identifiers: *Groundwater resources.

Nearly all usable groundwater in the San Joaquin Basin Subregion occurs in the alluvium-filled San Joaquin Valley. The aquifer system throughout the entire San Joaquin Valley is an integrated system; therefore, this report includes the Delta-Central Sierra Subregion, the Tulare Basin Subregion, and the San Joaquin Basin Subregion. Total storage capacity of the San Joaquin Valley is 93 million acre-feet. The usable storage capacity is 80 million acre-feet; low permeability in some areas is considered a limiting factor. Groundwater temperature ranges from about 45 degrees to about 105 degrees F. The dissolved-solids content of the water ranges from 64 to 10,700 parts per million. The predominant water type varies with the aquifer, but calcium, magnesium, sodium, bicarbonate, sulfate, and chloride are the main constituents. (Woodard-USGS)

GROUNDWATER DATA AS OF 1967--SACRAMENTO BASIN SUBREGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. S. Bader.
Geological Survey Open-file Report, Mar 5, 1969. 16 p, 1 fig, 31 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Reviews, Water table, Water levels, Water yield, Specific capacity, Withdrawal, Pumping, Groundwater recharge, Water temperature, Water quality, Chemical analysis, Dissolved solids, Aquifers, Hydrogeology, Water resources development.
Identifiers: *Groundwater resources.

Most usable groundwater in the predominantly mountainous Sacramento Basin Subregion occurs in alluvium-filled valleys and volcanic rocks of Quaternary and Tertiary age. Total storage capacity of 17 of the 21 basins is nearly 55 million acre-feet, of which more than 33 million is in the Sacramento Valley. The usable storage capacity in the Sacramento Valley is 22 million acre-feet; the limiting factors are economic considerations, aquifer materials of low permeability, and the quality of the water. Groundwater temperature ranges from about 55 degrees to about 75 degrees F. The dissolved-solids content of the water is generally less than 55 parts per million, but locally is as much as 2,790 ppm. The predominant water type is calcium bicarbonate, but sodium and magnesium are present locally in significant quantities. Properly constructed wells in some areas can yield as much as 3,100 gallons per minute. (Woodard-USGS)

Bur Reclam Transl 847, Jan, 1971. 52 p, 4 fig, 23 tab, 2 ref, append. Trans. of Vychisl tsentr, Akad Nauk Gruz SSR Tbilisi, 1968.

Descriptors: Foreign design practices, Mathematical analysis, *Arch dams, *Dam foundations, *Dam design, Hydraulic structures, Abutments, Design tools, Boundary values, Dams, Concrete dams, Foundations, Loads (Forces), *Deformation, *Displacements, Equations, Strain, Movement, Analytical techniques, Rotation, Formulas.
Identifiers: Vertical displacements, Horizontal displacements, USSR.

Vogt's method of analysis of arch dam foundations is modified to allow a parabolic distribution of load. Expressions for normal and horizontal displacement and angle change of the foundation are developed for normal, moment, and shearing loads. Lengthy expressions for constants used in the calculations which are a function of the foundation geometry and the location along the foundation are separated and identified. Tables of values for the constants are given for the expected range of foundation geometry and location along the foundation. The geometrical description of the foundation used for determining the parameters of the tables is given. (USBR)

Bureau of Reclamation, Denver, Colo.
G. B. Wallace, and W. H. Ortel.
Paper 12th Symposium on Rock Mechanics University of Missouri, Rolla, Mo, Nov, 1970. 27 p, 27 fig, 9 ref.

Descriptors: *Tunnel linings, *Tunnel supports, *Rock pressures, Loads (Forces), Rock bolts, Safety, Tunnel design, *Instrumentation, Measuring instruments, Pressure cells, Extensometers, Slope indicators, Analytical techniques, Strain meters, Strain gages, Rock mechanics, Deformation, In situ rock, Geology, Measurement.
Identifiers: Load cells, Joint meters, Photoelastic stress meters, Analytical method.

Tunnel measurements and their analysis may be the key that will give the insight necessary for understanding the relationship of rock, tunnel supports, and linings, resulting in improved safety, design methods, and geological interpretation of tunnel requirements. To accomplish these goals, the Bureau of Reclamation developed a tunnel instrument program to measure rock movement, loads on supports and linings, relative movement between rock and lining, and stresses in supports and lining. The instruments and the techniques used to install the instruments, as well as typical examples of output results are described. Instruments include tunnel diameter gage, single- and multiple-position extensometers, slope indicators, load and pressure cells, joint and strain meters, welded and bonded resistance strain gages, and photoelastic gages. NAVIGATION CONDITIONS AT LOCKS AND DAM NO. 4 MONONGAHELA RIVER, PENNSYLVANIA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco, and Cody D. McKellar, Jr.
Available from the National Technical Information Service as AD-720 548, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-736, Aug 1966. 55 p.

Descriptors: *Dams, *Model studies, *Flow, *Test procedures, Navigation, Locks, Pennsylvania.
Identifiers: *Hydraulic models, Pennsylvania, Waterways, Monongahela River (Pa).

Existing Locks and Dam No. 4 consist of two parallel locks with clear chamber dimensions of 56 by 720 ft and 56 by 360 ft and a fixed dam 540 ft long. Reconstruction of Dam 4 will involve replacement of the existing fixed dam with a nonnavigable-type gated dam with five 84-ft-wide gates and four 10-ft-wide piers. Provision will be made in the dam structure for ultimate replacement of the existing locks by two locks each 720 ft long, with one lock 84 ft wide and the other 110 ft wide. A 1:120-scale, fixed-bed model reproducing approximately 2.5 miles of the Monongahela River was used to determine the effect of the proposed reconstructed dam on flow conditions in the lock approaches with the existing and ultimate locks and for the development of modifications which might be required to provide satisfactory navigation conditions. Results indicated that stages upstream of the dam would be lowered and velocities in the upper approach would be increased during uncontrolled riverflows. The maximum flow at which navigation through the locks if feasible would be increased about 30 percent. With the lower stages and resulting higher velocities, tows would experience greater difficulties in approaching the existing locks. Conditions with the existing locks could be improved by construction of cells spaced about 20 ft apart as extensions to the existing guard wall; with the ultimate locks, ports should be provided in the upper guard wall to reduce or eliminate the strong crosscurrents near the end of the wall. Velocities in the upper lock approach could be reduced by deepening the channel along the left bank above the dam and by placing spoil on the channel bed on the right side. Removal of the spur dike upstream of the locks would increase velocities in the approach, but would improve the alignment of currents.

SMALL CHECK-DROP-ENERGY DISSIPATOR STRUCTURES,
Colorado State Univ., Fort Collins.
G. V. Skogerboe, V. T. Somoray, and W. R. Walker.
Paper 70-748, 1970 Winter Meet, American Society of Agricultural Engineers, Chicago, Ill Dec, 1970. 16 fig, 8 tab, 23 ref.

Descriptors: Check structures, Drops (Structures), Discharge (Water), *Energy dissipators, Bibliographies, *Design criteria, Design, Hydraulic jump, *Laboratory tests, Models, *Model tests, Hydraulics, Research and development, Stilling basins, Spillways, Critical depth, Hydraulic structures, Costs.
Identifiers: Baffle blocks.

Existing information has been used extensively in developing design relationships for various geometric forms of check-drop-energy dissipator structures. Design criteria for numerous types of rigid boundary stilling basins are available, but much of the literature is concerned with particular structures for special use rather than general information. The material of general nature is scattered in numerous laboratory and project reports or design manuals. The problem is to evaluate existing information to determine what research is necessary for developing generalized design procedures. Once the necessary basic research is available, various types of structures can be designed, but verifying the designs by laboratory model studies will be desirable. Examples of check-drop-energy dissipator structures illustrate that information is available for designing rigid boundary stilling basins over a wide range of flow conditions. (USBR)

DETERMINATION OF CHANNEL CAPACITY OF THE FRESNO RIVER DOWNSTREAM FROM HIDDEN DAMSITE, MADERA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
Gilbert L. Bertoldi, and J. C. Blodgett.
Geological Survey Open-file Report, 1971. 45 p, 3 fig, 3 tab, 6 ref.

Descriptors: *California, *Flood routing, *Channel improvement, *Design flood, *Flood protection, Flash floods, Maximum probable flood, Historic flood, Regional flood, River forecasting, Dikes, Flood control, Floodgates, Floodproofing, Cloudbursts, Peak discharge, Multiple-purpose projects, River basin development.
Identifiers: *Madera County (Calif), *Madera (Calif), *Fresno River (Calif).

A channel capacity study was made in the general vicinity of the town of Madera some 25 miles northwest of Fresno, California to aid in the evaluation of a major flood control project in that area. This project included portions that had been inundated in the past and was especially designed to cover those areas affected by the flood of February 24-25, 1969. The adequacy of the existing channel was investigated using 89 flood profiles at various discharges ranging from 2,500 cfs to 18,000 cfs. Computed water-surface elevations indicate that discharges of 5,000 cfs and 8,000 cfs easily be contained within the channel. Upstream from the Railway bridge, a discharge of 10,000 cfs will cause local flooding. Flooding of agricultural land south of the Fresno River and between cross sections 64 and 68 could occur if a discharge of 10,000 cfs were routed entirely down the main channel. However, the South Fork normally carries flows when the main channel flow exceeds about 1,500 cfs. (Glasby-USGS)

escriptors: *Earthquakes, *Hydrodynamics, arthquake engineering, Fluid friction, Pressure, elocity, Hydrostatic pressure.
entifiers: Fluid force.

rge fluid forces are exerted on dams and other derwater structures when the structures are acelerated by earthquakes. Similarly, piles and offore towers subjected to waves must be able to thstand large forces caused by the accelerating id. The accelerative force problems of interest to gineers frequently involve periodic motion, but nperiodic motion also is important. Whether or t the motion is periodic, the presence of a surunding fluid demands that the external force aped to a body to produce a stipulated acceleration larger than would be required if the fluid were sent. The body behaves as if a mass in addition to own were attached to it. This is the concept of ded mass. The mean added mass coefficient from acceleration tests on 4-inch and 6-inch spheres eased from rest in water was 0.501. Because the ded mass coefficient from inviscid theory is 0.50, viscosity of the water did not influence the ded mass. Seventy-eight measurements imediately after acceleration from nominally connt speeds of 0.1 fps to 0.7 fps showed no tenncy of the coefficient to depend on speed or on ether the acceleration was in the same direction the velocity or in the opposite direction. entifiers: Cross-bedding.

gration of megaripples and sand waves in shalv seas and estuaries suggests a possible model for formation of widespread marine cross-bedding. st examples have been studied only externally, ny of them from echo-sounding; their internal ucture is unknown, but cross-bedding has been umed. Megaripples in King Sound are exposed low tide and their internal structure has been exined. Many are cross-bedded with steeply dipping foresets. Facing of the foresets indicates that they may be developed by either the flood or ebb tide. The current direction implied by external morphology appears to be a reliable guide to that indicated by the cross-bedding. (Knapp-USGS)

Descriptors: *Coastal engineering, *Ocean waves, *Littoral, *Beaches, *Sediment transport, Shore protection, Hydraulic structures, Model studies, Laboratory tests, Test procedures, Harbors, Beach erosion, Engineering structures.
Identifiers: Wave forecasting.

Laboratory and field studies are discussed in developing a better understanding of the interaction of the beach and the littoral zones with and without manmade structures. Wave action is the most important factor influencing movement of sediments along U.S. shores. In many localities, the direction and rate of material movement may be determined directly from the rates of accretion and erosion at shore structures. Such determinations are accurate at the initial installation of the structure, or after cleaning a deposition area by a sand bypassing operation. Where there is no background of experience from shore structures, information on the direction (but not magnitude) of littoral movement can be obtained in many areas from the shore patterns near headlands where sediment accumulates on the updrift side, and an eroded embayment occurs on the downdrift side. A summary of major littoral factors pertinent to design of coastal works is included. (Woodard-USGS)

RIVER BED DEGRADATION,
Asian Inst. of Tech., Bangkok (Thailand).
Sadequr Rahman.
M Sc Thesis No 266, Asian Institute of Technology, 1969. 87 p, 31 fig, 4 tab, 22 ref, 4 append.

Descriptors: *Streamflow, *Channel erosion, *Dams, Regulated flow, *Sediment transport, Model studies, Flumes, Sediments, Particle size, Analytical techniques, Mathematical studies, Shear, Stress analysis, Roughness coefficient, Equations, Channel morphology.
Identifiers: Channel degradation.

The construction of a dam across a river changes the position of the streambed and water levels downstream from the dam. A study of these changes was made. Experimental investigation was conducted in a recirculating rectangular flume. The flume was 72 ft long, 2 ft wide and 2.5 ft deep. The sand bed layer was 8 inches high. Bed materials were almost uniform size having a medium diameter of 0.42 mm and a standard deviation of 1.27. Analytical solution was done using Tinny's theory, with some modifications. The result of the bed degradation obtained by computation agree reasonably with the measured data, except near the dam where the observed degradation was more than the computed one with a maximum difference of 35%. Critical shear stress sediment characteristic and roughness coefficient were also determined from the laboratory data. (Woodard-USGS)

MODEL STUDIES OF NAVIGATION IMPROVEMENTS, COLUMBIA RIVER ESTUARY. REPORT 1. HYDRAULIC AND SALINITY VERIFICATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Frank A. Herrmann, Jr.
Available from the National Technical Information Service as AD-720 545, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-735, Dec 1968. 262 p.

Descriptors: *Break waters, *Model studies, *Estuaries, *River flow, Salinity Tides, Sedimentation, Test procedures, Jetties, Columbia River.
Identifiers: *Hydraulic models, Test equipment.

The Columbia River estuary model was a combination fixed-bed and movable-bed model, constructed to scales of 1:500 horizontally and 1:100 vertically, and reproduced the lower 52 miles of the Columbia River and an adjoining portion of the Pacific Ocean. The model was equipped with the necessary appurtenances for accurate reproduction and measurement of tides, tidal currents, salinity intrusion, freshwater inflow, shoaling distribution, and other significant prototype phenomena. The purpose of the model study was to determine optimum plans for the rehabilitation of the stone jetties in the river entrance, to determine and evaluate the effects of a proposed enlargement of the existing navigation channel from 35 by 500 ft to 40 by 600 ft, and to develop and evaluate various plans for the reduction of maintenance dredging costs throughout the model area. Model verification tests indicated that the model hydraulic and salinity regimens were in satisfactory agreement with those of the prototype for comparable conditions. It therefore can be assumed that the model provided quantitative answers concerning the effects of the proposed plans on the hydraulic and salinity regimens of the estuary. (See also W71-09342 and W71-09343)

MODEL STUDIES OF NAVIGATION IMPROVEMENTS, COLUMBIA RIVER ESTUARY REPORT 2. ENTRANCE STUDIES, SECTION 1. FIXED-BED STUDIES OR SOUTH JETTY REHABILITATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Frank A. Herrmann, Jr., and Henry B. Simmons.
Available from the National Technical Information Service as AD-720 546, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-735, Aug 1966. 163 p.

Descriptors: *Breakwaters, *Model studies, *Estuaries, *Jetties, River flow, Tides, Salinity, Test procedures, Columbia River, Tides, Sedimentation.
Identifiers: *Hydraulic models, Damage control.

The existing comprehensive fixed-bed model of the Columbia River estuary was used to determine the need for rehabilitating all or part of the outer end of the existing south jetty. This jetty has seriously deteriorated during the past 25 years, and an extensive rehabilitation program has been undertaken. Model tests were conducted to determine the effects of various stages of repair of the outer 1900 ft of the jetty on the hydraulic, salinity, and shoaling characteristics of the entrance area. Tests results consist of tidal elevation measurements, current velocity measurements, salinity measurements, photographs of surface and bottom current patterns, and shoaling patterns. The results of the model tests indicate that rehabilitation of the existing outer end of the south jetty will not significantly benefit the hydraulic, salinity, or shoaling characteristics of the entrance area as a whole, although it is possible that some additional protection to vessel traffic from ocean wave action would be effected by the rehabilitation. The test results indicate further that shoaling of the entrance channel will

be significantly reduced, especially at the inner bar, if the seaward 1900 ft of the south jetty is allowed to degrade to an elevation of about -15 ft mllw. (See also W71-09341)

Descriptors: *Breakwaters, *Model studies, *Estuaries, *Riverflow, Jetties, Test procedures, Columbia River, Salinity, Tides, Sedimentation.
Identifiers: *Hydraulic models, Damage control.

The existing, comprehensive fixed-bed model of the Columbia River estuary was used to determine the need for rehabilitating all or part of the outer end of the existing north jetty. This jetty has seriously deteriorated during the past 25 years, and a rehabilitation program has been undertaken. Model tests were conducted to determine the effects of various stages of repair of the outer 1800 ft of the jetty on the hydraulic, salinity, and shoaling characteristics of the entrance area. Test results consist of tidal elevation measurements, current velocity measurements, salinity measurements, photographs of surface and bottom current patterns, and shoaling patterns. The results of the model tests indicate that complete rehabilitation of the outer end of the jetty will provide moderate benefits to the hydraulic, salinity, and shoaling characteristics of the entrance area as a whole when compared with results of tests with the outer 1400 ft of the jetty degraded to -15 ft mllw, simulating conditions which may obtain if that portion of the jetty is not rehabilitated. However, it is recommended that before the outer end of the jetty is repaired, more detailed movable-bed tests be performed to determine the optimum jetty condition. (See also W71-09341).

INVESTIGATION OF IN-SHORE HARBOR, SITE X. REPORT 1. DESIGN FOR OPTIMUM WAVE CONDITIONS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
H. B. Wilson.
Available from the National Technical Information Service as AD-720 973, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-740. 77 p, 7 ref.

Descriptors: *Breakwaters, *Model studies, *Harbors, *Ocean waves.
Identifiers: *Hydraulic models, South China Sea, Harbor models.

The area for which the Site X harbor was proposed assumed a location in the South China Sea where an entrance channel leading into the harbor could be dredged inland approximately normal to a straight shoreline. The offshore hydrography was idealized in that the depth contours were assumed to be parallel to the shoreline and correspond to a bottom slope of 1:30. The entire inner-harbor area, approach channel, proposed protective breakwater system and wave absorbers, along with sufficient adjacent coastline and offshore hydrography necessary to the accurate simulation of storm-wave action, were reproduced in a 1:100-scale hydraulic model equipped with wave-generating and wave-height-measuring devices. The purpose of the model study was to determine the efficacy of the proposed breakwaters and companion in-harbor wave absorbers in providing adequate protection for T-1-Tanker and LST-1171 type craft berthed in the harbor during storm-wave action. It was concluded that (a) an arrowhead type of breakwater system or a parallel-jetty arrangement, with the breakwater arms so positioned as to provide a navigation entrance 420 ft wide, a 120-ft-wide, 24-ft-deep dredged navigation channel and a 24-ft-deep dredged inner-harbor basin, in combination with the proposed wave-absorber systems, would provide excellent protection against severe storm waves for the types of boats that would make use of the inner harbor, (b) adequate inner-harbor protection against storm waves would also be realized, with either a parallel-jetty or arrowhead-type breakwater system, for a 530-ft-wide navigation entrance between the outer ends of the breakwaters or jetties and with a dredged navigation channel, 120-ft-wide with a depth of 35 ft, leading into a 35-ft-deep inner-harbor basin. (See also W71-09346)

INVESTIGATION OF IN-SHORE HARBOR, SITE X. REPORT 2. DESIGNS OF RIPRAP COVER LAYERS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Jackson.
Available from the National Technical Information Service as AD-720 982, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-740, Sept 1966. 43 p, 2 ref.

Descriptors: *Breakwaters, *Harbors, *Model studies, *Ocean waves, Riprap.
Identifiers: *Hydraulic models, South China Sea.

Two series of stability tests on riprap cover layers were conducted in a 2-ft-wide wave flume using a 1:15-scale model. In the first series, riprap cover layers on composite beach slopes of 1:30 and 1:8 were investigated. These slopes reproduced the natural beach slopes on each side of the entrance channel dredged from deep water to the in-shore harbor. In the second series of tests, riprap cover layers on a slope of 1:5 were investigated. These cover layers were for protection of the entrance-channel side slopes from the erosive action of waves. Also, the crown elevations of the various riprap sections were determined. Stable riprap designs were developed for all sections that required riprapping. Because the larger waves broke before reaching the area of the still-water level, the size riprap required to protect the 1:30 and 1:8 beach slopes was small. The size riprap required to protect the submerged side slopes of the dredged entrance channel was found to be a function of both wave height and water depth at the crest of the submerged channel slope. For a given wave height, side slope, and specific weight of rock, the required size of riprap increases as the water depth, measured at the crest of the slope, decreases. For similar riprap sections with an unsubmerged crest, the required size of riprap is primarily a function of wave height. (See also W71-09345)

DESIGN FOR OPTIMUM WAVE CONDITIONS, DANA POINT HARBOR, DANA POINT, CALIFORNIA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Howard B. Wilson.
Available from the National Technical Information Service as AD-720 190, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-724, June 1966. 55 p, 9 ref.

Descriptors: *Breakwaters, *Harbors, *Model studies, *Shore protection, Ocean waves, Winds, Storms, Construction materials, California.
Identifiers: *Hydraulic models, Bathythermograph data, Water traffic, Patrol craft, Seacoast, *Dana Point Harbor, Rubble mound breakwaters, *Dana Point (Calif).

The entire Dana Point area that will be enclosed by Dana Point Harbor and sufficient adjacent coastline and offshore bathymetry to permit accurate simulation of storm-wave action were reproduced in a 1:100-scale hydraulic model equipped with wave-generating and wave-height-measuring devices. The purpose of the model study was to determine the effectiveness of the proposed breakwater system and inner-harbor basin in providing protection from storm action for pleasure craft and fishing boats berthed within the harbor. It was concluded that the proposed breakwater system, which consists of a 5500-ft-long west breakwater and a companion 2250-ft-long east breakwater with a 600-ft-wide navigation entrance at the southeast corner of the harbor, will provide the degree of protection required for small boats to berth safely in the partially enclosed inner-harbor basin. Investigation of the wave-transmission problem, concerning the degree of wave energy that can reach the inner harbor through the interstices of the proposed rubble-mound breakwaters, showed that the wave energy transmitted to the inner basins of the harbor through the outer breakwater structures is not critical. Wave energy transmitted into the fairway by overtopping of the proposed west breakwater by near-maximum storm waves, which have a low frequency of occurrence, was found to cause conditions in the fairway that would be dangerous to small craft. However, it was determined that modification of the mole slope flanking the fairway to include a berm will reduce the wave-reflecting characteristics of this structure, and thereby reduce wave action in the fairway considerably during severe storms.

FILLING AND EMPTYING SYSTEMS, LOWLIFT LOCKS, ARKANSAS RIVER PROJECT. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Jackson H. Ables, Jr., and B. Boyd Marden.
Available from the National Technical Information Service as AD-720 975, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-743, Nov 1966. 188 p.

Descriptors: *Dams, *Model studies, *Locks, Flow, Drainage, Arkansas River, Culverts.
Identifiers: *Hydraulic models, Filling, Hydraulic systems, Culverts.

The low-lift locks on the Arkansas River will be 110 ft wide by 670 ft long (pintle to pintle) and will have normal lifts ranging from 14 to 30 ft. There are 15 low-lift locks at which conditions are similar enough that relatively little change in the design of the lock hydraulic system will be required at the different sites. Results of tests of the hydraulic system for these projects in a 1:25-scale model are presented in this report. Two satisfactory culvert intake manifolds were developed, a 6-port type 2 intake and an 8-port type 4 intake. The original design culvert outlet manifold which discharged into the lower lock approach performed satisfactorily. Tests of 74 sidewall port arrangements resulted in the development of five port arrangements using type A or D ports considered suitable for use at the Arkansas River low-lift projects. The type A ports are 2.54 ft wide by 3.50 ft high and the type D ports are 2.54 ft wide by 4.10 ft high. At lock 2 design conditions, 20-ft lift and 17-ft submergence (base test conditions in the model study), the recommended arrangements permit the lock to be filled in 7.5 min or less with acceptable turbulence conditions in the lock chamber and maximum hawser stresses not exceeding 5 tons. The lock can be emptied in less time with lower hawser stresses.

SPILLWAY AND NAVIGATION CONDITIONS, HOLT LOCK AND DAM, WARRIOR RIVER, ALABAMA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. S. Melsheimer, and T. E. Murphy.

vailable from the National Technical Information ervice as AD-720 979, $3.00 in paper copy, $0.95 n microfiche. WES Technical Report No 2-745,)ct 1966. 72 p.

)escriptors: *Dams, *Model studies, *Spillways, Locks, Culverts, Flow navigation.
dentifiers: *Hydraulic models, Hydraulic systems, Alabama, Holt Dam, Warrior River.

The hydraulic model investigations reported herein ere concerned with navigation conditions in the ock approaches, performance of the spillway, the easibility of lock culvert intakes and outlets on the verside of the riverward lock wall, and flows hrough the first and second construction stage iversion channels. Tests were conducted on two nodels: a 1:80-scale general model which eproduced 4800 ft of the approach channel, the pillway, the powerhouse, the navigation lock, and 800 ft of the exit channel; and a 1:36-scale section nodel of one spillway gate bay and adjacent half ays. Navigation conditions in the upstream lock pproach were excellent. Flows from the power-ouse created a strong eddy in the downstream ock approach. This eddy could not be eliminated y a feasible plan of excavation or a system of train-ng walls. However, a rock dike installed in the ver channel intercepted the crosscurrent and esulted in acceptable navigation conditions. The apacity of the spillway was not as great as had een computed. Model tests indicated reasonable eir and pier contraction discharge coefficients but xcessive losses at the abutments and a submer-ence effect of the tailwater. The excessive losses t the abutments were reduced by modifications of ne end piers. A stilling basin was not deemed ecessary, and model tests were used to develop a oe curve which deflected the nappe away from the mmediate toe of the spillway. The feasibility of the ock culverts' intake and discharge systems was erified. The adequacy of both the first and second onstruction stage diversion schemes was stablished.

NAVIGATION CONDITIONS AT LOCK AND DAM NO 4, ARKANSAS RIVER. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco, and Cody D. McKellar.
Available from the National Technical Information Service as AD-720 984, $3.00 in paper copy, $0.95 n microfiche. WES Technical Report No 2-746, Oct 1966. 84 p.

Descriptors: *Dams, *Locks, *Model studies, Navigation, Inland waterways, River flow.
Identifiers: *Hydraulic models, River currents, Arkansas River, Rob Roy Bridge.

Lock and Dam No 4 will consist of a 110- by 600-ft ock and a 1190-ft-long, gated, nonnavigable dam. A 1:120-scale, fixed-bed model, reproducing 5.2 miles of the Arkansas River, was used to: (a) demonstrate flow conditions in lock approaches nd in vicinity of Rob Roy Bridge (1.3 miles above ock); (b) determine effect of various guard wall esigns on forces affecting tows in upper lock ap-roach; (c) determine optimum location of harbor nd dock, and mooring facilities; (d) measure dis-ribution of different flows throughout the model; nd (e) furnish information for use in developing nodifications of the approaches and structures to mprove navigation conditions. Tests were con-erned with study of flow patterns, measurement of elocities in lock approaches, and behavior of a nodel tow on entering and leaving the locks and avigating through Rob Roy Bridge under flows anging from 100,000 to 350,000 cfs. Test results ndicated: (a) location of lock and dam with espect to Rob Roy Bridge was satisfactory; (b) ock upper guard wall (riverside) instead of a guide vall should be used to provide satisfactory naviga-ion conditions. Port capacity of the guard wall hould be sufficient to eliminate hazardous cross-currents; (c) harbor and dock facilities should be ufficiently far upstream of lock to eliminate their effects on navigation approaching the lock; (d) navigation through existing Rob Roy Bridge swing span might be hazardous during high flows because of high velocities and limited bridge opening. Removal of a point along right bank at bridge would reduce velocities without affecting navigation conditions downstream of bridge; (e) navigation conditions in lower approach should be satisfactory.
W71-09350

FILLING AND EMPTYING SYSTEMS, MILLERS FERRY AND JONES BLUFF LOCKS, ALABAMA RIVER, ALABAMA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Jackson H. Ables, Jr., and Marden B. Boyd.
Available from the National Technical Information Service as AD-720 192, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-718, Mar 1966. 116 p.

Descriptors: *Dams, *Model studies, *Flow, Drainage, Test procedures, Alabama.
Identifiers: *Hydraulic models, Hydraulic systems, Filling.

Filling and emptying systems for the 600- by 84-ft Millers Ferry (48-ft lift) and Jones Bluff (45-ft lift) Locks will comprise two intake ports in the river side of the upper gate block, 10-ft-square culverts in each wall, a lateral crossover culvert at the midpoint of the lock leading to four longitudinal floor culverts with side ports, and culvert outlets which empty riverward of the lock in the common outlet basin. Reverse-mounted tainter valves control flow in the system. The hydraulic system was tested in a 1:25-scale model. Original design intakes and outlets performed satisfactorily. The major portion of the study was devoted to developmental tests of a new type of filling system, the longitudinal floor culvert system. Two systems were developed, one to conform to site restrictions at the Millers Ferry project and a second for use at the Jones Bluff project where no space limitations are placed on the system. Pressures were satisfactory except just downstream from the filling valves; pressures recorded in these areas may result in cavitation. Admission of small controlled quantities of air just downstream of the valves should cushion the collapse of vapor pockets and minimize possible damage without adversely affecting performance of the system. With the adopted hydraulic system installed in the model, hawser stresses on 6and 12-barge tows were well within the 5-ton limit during operations with normal heads and 14-ft submergence. The longitudinal floor culvert systems investigated exhibited several favorable characteristics which suggest that these systems may be used effectively in larger and higher-lift locks. However, much additional developmental work is needed prior to the use of such a system at projects with larger locks or significantly higher lifts.

FILLING AND EMPTYING SYSTEM, CORDELL HULL NAVIGATION LOCK, CUMBERLAND RIVER, TENNESSEE. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Noel R. Oswalt, and Marden B. Boyd.
Available from the National Technical Information Service as AD-720 977, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-739, Sept 1966. 89 p.

Descriptors: *Dams, *Model studies, *Drainage, *Locks, Flow, Tennessee.
Identifiers: Hydraulic models, Filling, Hydraulic systems, Mechanical drawings, Cordell Hull Dam, Cumberland River.

Cordell Hull Lock will be 84 ft wide by 450 ft long and will have a normal lift of 59 ft with a maximum lift of 62 ft occurring about 5 percent of the time. Model study (scale 1:25) of the filling and emptying system proposed for this lock was confined to the portion of the hydraulic system between the filling and emptying valves. Performance of the type 1 (original) multiport arrangement was, in general, satisfactory even though it was evident from test results that certain improvements could be made in the system. The lock chamber manifold includes three horizontal rows of seventy-two 8-in.-diam ports resulting in an overall port area/culvert area ratio of 0.75 based on the culvert area at the valves. The manifold extends over 48 percent of the chamber length and is centered about 3.9 percent of the chamber length upstream from the midpoint of the chamber. The ports discharge into a 3-ft-wide by 6.5-ft-deep trench along the toe of the lock wall. With the proposed filling-emptying system the lock can be filled in 11.0 min (4-min valve) and emptied in 11.2 min (1.5-min valve) with acceptable hawser stresses and turbulence conditions in the chamber. Consideration of the performance of the system and construction schedules at the project resulted in its adoption for use at the Cordell Hull project. However, additional tests of the multiport system were conducted since this type of system was under consideration for use at another project. These tests resulted in several suggestions for improvements in the system. Port arrangements in which conventional sidewall ports discharged into a trench at the toe of the lock wall were also investigated, but their performance did not compare favorably with that of the better multiport arrangements.

CULVERT PRESSURES, GREENUP LOCK, OHIO RIVER, KENTUCKY. HYDRAULIC PROTOTYPE TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Peter M. Smith, and Ronald A. Yates.
Available from the National Technical Information Service as AD-720 544, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-734, July 1966. 45 p.

Descriptors: *Dams, *Model studies, *Locks, *Test procedures, Drainage, Hydrostatic pressure, Kentucky, Culverts.
Identifiers: *Hydraulic models, Filling, Test facilities, Greenup Dam.

Prototype tests were conducted at Greenup Lock to investigate pressures in the filling and emptying systems of the main lock and water-surface elevations in the lock chamber. Continuous measurements were made with valve opening and closing periods of 4 and 8 min for conditions of two-culvert (normal) operation, single-culvert operation, and steady flow. The steady-flow tests yielded data concerning head loss coefficients through the lock manifolds and laterals. Discharge coefficients for two-culvert operation were also obtained. These data were compared with results obtained from the hydraulic model study. Dissimilarities between model and prototype results are thought to be largely due to dissimilarities between model and prototype designs. However the test results are believed to substantiate the validity of the model.

DROP STRUCTURES FOR WALNUT CREEK PROJECT, WALNUT CREEK, CALIFORNIA. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. A. Pickering.
Available from the National Technical Information Service as AD-720 187, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-730, June 1966. 57 p, 3 ref.

Descriptors: *Dams, *Model studies, *Stilling basins, *Flow, Riprap, Test procedures.
Identifiers: *Hydraulic models, Walnut Creek (Calif).

Walnut Creek project will provide for enlargement and rectification of the existing channels of Walnut, Lower San Ramon, and Las Trampas Creeks. Three grade control structures and one energy dissipating structure will be used to reduce velocities and dissipate excessive energy from flood flows. Model investigations were conducted on 1:20-scale models of drop structures 2 and 3. Tests were concerned with determining the optimum size and configuration of the stilling basins for these structures, the stability of the riprap downstream from the stilling basins, and the adequacy of the inlet transition upstream from dropstructure 2. Tests revealed that flow conditions produced by the original design stilling basins of both structures were unsatisfactory. Several modifications to drop structure 2 were tested in an effort to reduce the high velocities and surface waves that occurred in the exit channel with the original design. A stilling basin that resulted in satisfactory flow conditions with the design discharge was developed. The riprap requirements in the exit channel downstream from the stilling basin were determined. Flow conditions through the inlet transition upstream from drop structure 2 were satisfactory for all discharges tested.

REDUCTION OF SHOALING IN CHARLESTON HARBOR AND NAVIGATION IMPROVEMENT OF COOPER RIVER, SOUTH CAROLINA HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
William H. Bobb, and Henry B. Simmons.
Available from the National Technical Information Service as AD-720 193, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-733, July 1966. 166 p.

Descriptors: *Harbors, *Model studies, *Shoals, *Inland waterways, Salinity, Test procedures, Sedimentation, Tides, South Carolina.
Identifiers: *Hydraulic models, River currents, Cooper River, Wando River, Charleston Harbor, Cooper River, South Carolina.

The existing comprehensive fixed-bed model of the Charleston Harbor system was used to conduct several special-purpose studies. These studies involved a proposed silt trap in Wando River, salinity investigations, a proposed spoil area dike, a scheme to redivert powerhouse discharge from Cooper River into Wando River, intermittent powerhouse operation to meet peak demands, and a proposed extension of the existing navigation channel in Cooper River. In general, model tests were conducted to determine the effects of the several proposals on tides, currents, and salinities throughout the estuary, and test results consist primarily of measurements of tide heights, current velocities, salinities, time-exposure photographs of surface current patterns, graphic illustrations of dye dispersion, and analyses to determine flow predominance.
W71-09355

SPILLWAY AND OUTLET WORKS, SHELBYVILLE DAM, KASKASKIA RIVER, ILLINOIS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Don R. Bucci, and John L. Grace, Jr.
Available from the National Technical Information Service as AD-720 186, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-719, June 1966. 131 p.

Descriptors: *Dams, *Model studies, *Spillways, *Stilling basins, Outlet works, Test procedures, Flow, Construction materials, Hydrostatic pressure, Illinois.
Identifiers: *Hydraulic models, Shelbyville Dam, Kaskaskia River (Ill).

Tests were conducted on a 1:40-scale model reproducing the spillway for Shelbyville Dam, a combination concrete and earth structure rising 108 ft above the bed of the Kaskaskia River. The spillway consists of an ogee crest controlled by three tainter gates 45.33 ft wide and 36.92 ft high; a 156-ft-2ide, 206-ft-long chute sloped 1 on 4; and a conventional hydraulic jump type stilling basin. The design flood, 162,500 cfs, will be passed at pool elevation 638.2 by combined operation: 157,500 cfs over the spillway and 5000 cfs through two 11-ft-high by 5.5-ft-wide sluices through the spillway section beneath the piers. Flow conditions in the approach, discharge characteristics of the spillway, hydrostatic pressures on the ogee weir crest, performance of the conventional stilling basin, and the height of the training walls were investigated. The limits of two exit channel protection plans involving the use of various sizes and gradations of stone and concrete paving were developed with and without berms behind the training walls. Surging at the abutments was minimized and weir capacity was increased by the use of rock dikes near the abutments. The spillway rating curve determined by the model was inadequate, yet reasonably compatible with the theoretical rating curve; and the combined capacity of the adopted spillway and sluices was adequate. Heads greater than the design head created negative pressures on the weir crest as expected; however, cavitation was not indicated. Satisfactory energy dissipation was obtained with a 125-ft-long horizontal stilling basin at the elevation dictated by foundation conditions (513.0) surmounted by two rows of 10-ft-high baffle piers and terminated by a 5-ft-high vertical-faced end sill. The model indicated that the height of the stilling basin training walls could be reduced 5 ft.
W71-09357

NAVIGATION CONDITIONS AT BELLEVILLE LOCKS AND DAM, OHIO RIVER,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco, and Louis J. Shows.
Available from the National Technical Information Service as AD-720 549, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-738, Sept 1966. 56 p.

Descriptors: *Dams, *Model studies, *Flow, *River flow, Navigation, Sites, Test procedures, West Virginia, Ohio, Locks, Canals.
Identifiers: *Hydraulic models, Site selection, Belleville Dam, Ohio River.

Belleville Locks and Dam, designed to maintain during low flows a single upper pool extending upstream 41.7 miles, will replace Locks and Dams Nos. 18, 19, and 20 of the present Ohio River navigation system. The dam will consist of a non-navigable gated structure 892 ft long with a damming height of 32 ft, and a 265-ft-long, fixed-crest weir connecting the gated spillway with the left bank. The locks, on the right bank, are to be of the high-lift type (ultimate 22 ft) consisting of two parallel chambers having clear dimensions of 110 by 1200 ft and 110 by 600 ft. An undistorted 1:120-scale, fixed-bed model, reproducing approximately 3.1 miles of the Ohio River and the lock and dam structures, was used to study the adequacy of the proposed design, to determine the best location for the locks under various flow conditions, and to develop measures to overcome or minimize the effects of any adverse conditions noted. The results of the investigation indicated that, because of the alignment of currents, the locks and dam should be shifted to the right as far as practicable to improve navigation conditions in the upper lock approach and flow distribution through the dam. The swell-head through the structures during medium flows could be reduced by increasing the number of dam gates from seven to eight. Velocities in the upper approach will tend to be high, but can be reduced by the use of submerged dikes.

STEADY-FLOW STABILITY TESTS OF NAVIGATION OPENING STRUCTURES, HILO HARBOR, TSUNAMI BARRIER, HILO, HAWAII, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Noel R. Oswalt, and Marden B. Boyd.
Available from the National Technical Information Service as AD-720 981, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-742, Oct 1966. 17 p, 16 photos, 14 plates.

Descriptors: *Breakwaters, *Model studies, *Harbors, Ocean waves, Hawaii, Tsunamis.
Identifiers: *Hydraulic models, Hilo Harbor (Hawaii).

Steady-flow tests of navigation opening structures in the Hilo Harbor tsunami barrier were conducted to determine the effect of tsunami-induced high-velocity currents through the navigation opening on stability of the barrier heads. Tests were conducted in a 1:60-scale model which reproduced one-half of the navigation opening and a 1:72-scale model which reproduced the full opening. Steady flow through the opening with a head differential of 28 ft across the barrier was the basic test flow, representing the peak flow condition caused by the design tsunami. Tests were designed to determine the cover-stone size required on the barrier heads for stability under this steady-flow condition and also to investigate methods for providing toe protection for barrier heads constructed on sand. Results of the steady-flow tests were to be correlated with results of model tests concerned with wave action and with other factors to develop the optimum design of the tsunami barrier. Steady-flow test results indicated that the barrier head cover-stone size needed for stability under steady flow was considerably smaller than that needed for stability against wave action. Test results also showed that the only reliable method of obtaining stable barrier heads was to construct them on a rock foundation. If conditions made this impractical, a protective blanket of stone covering the entire channel bottom through the navigation opening was recommended to protect the toe of the barrier heads. Additional stone placed around the toe of the barrier to 'armor' the toe as sand scoured away was not recommended unless the depth of sand at the site was shallow and unless repair and maintenance operations could be performed after each tsunami until the currents removed all sand, leaving the barrier heads resting on rock.

Descriptors: *Discharge measurement, *Hydraulic turbines, *Current meters, *Water measurement, Discharge (Water), Flow measurement, Flow, Flow around objects, Errors, Turbulent flow, Analysis, Instrumentation, Electronic equipment,

odel tests, Laboratory tests, Reproducibility, mputer applications, Accuracy, Reliability.

method of using cable-suspended current meters r measuring discharges in the intake passages of draulic turbines was developed by the Corps of gineers. The procedure is used in plants with in- ke passages changing cross section leading rectly into the scroll case without a penstock. The ble suspension system reduces distortion of the w because the slender cables on which the cur- nt meters are mounted are too far apart to cause cumulative effect. The apparatus used and the ethods of making measurements are described d compared with rigid-frame-type installations d measurements. Results obtained from the ble-suspended method of turbine-discharge mea- rement have been successful with an accuracy of easurement within 2%, meeting all requirements most acceptable codes. (USBR)

Identifiers: USSR, *Cavitation parameters, Baksansk Powerplant, USSR, Stroboscopic lighting, Bratsk Powerplant, USSR.

Results of experiments on laboratory test stands and prototype turbines show that operating conditions play a large part in the development of cavitation erosion. Stroboscopic observation of flow in models shows that vapor cavities form on blades of turbines before the onset of the disruption of efficiency. Two types of cavitation are discussed: one type forms from separate vapor bubbles which join into a bubble of significant size, and the other forms from pulsating vapor cavities varying in frequency. The use of cavitation-resistant stainless steel did not eliminate cavitation damage in many cases. In test models, the method of accelerated erosion was used to simplify the determination of damage. The cited measures for selected operating conditions, unit submergence, and blade design are recommended to meet the requirements of cavitation-free operation, and will not necessarily lead to a decrease in turbine efficiency. Laboratory tests and field observations were conducted on Kaplan and Francis runner blades, including Bratsk and the Krasnoiarsk prototype installed at Baksansk Hydropowerplant. (USBR)

SAFETY FACTORS IN SOIL MECHANICS,
Nova Scotia Technical Coll., Halifax.
G. G. Meyerhof.
Canadian Geotechnical Journal, Vol 7, No 4, p 349-355, Nov 1970. 7 p, 2 fig, 2 tab, 27 ref.

Descriptors: *Safety factors, *Soil mechanics, Probability, Stability analysis, *Earthworks, Earth dams, *Foundations, Variability, Retaining walls, Soil properties, Risks, Loads (Forces), Bibliographies, Failure (Mechanics), Safety, Sliding resistance, Foreign research.
Identifiers: Canada.

The safety margin in earthwork and foundation engineering is considered in relation to soil exploration and tests, analysis of stability under applied loads, and construction and operation of the structure during service life. Customary overall and suggested partial safety factors used in stability analyses are governed mainly by the variability and uncertainty of assessment of soil resistance, the variability of applied loads, approximations in stability analyses, and the seriousness of a failure. On the basis of probability concepts of safety, the conventional overall safety factors used in earthwork and foundation engineering analyses are related to approximate probabilities of stability failure and to a range of overall coefficients of variation. Safety analysis of earthworks indicates that customary overall safety factors for large earth-retaining structures and foundations are fairly adequate, and that unless careful performance observations are made during and after construction, earth dams should be designed for a minimum overall safety factor of about 1.7 (USBR)

STUDIES OF INTER-PARTICLE VOID CHARACTERISTICS,
Geoffrey Lees.
Quarterly Journal of Engineering, Vol 2, No 4, p 287-299, May 27, 1970. 13 p, 4 fig, 3 plate, 4 tab, 18 ref, append.

Descriptors: *Pores, *Porous media, *Voids, *Interstices, Particle shape, Particle size, Aggregates, Graded.

A method is described for studying characteristics of the voids contained within a mass of aggregate particles. Measurements were made on void cells dissected from single size aggregate systems of a variety of particle shapes in dense and loose packings. The measurements refer to the critical ratio of occupation and the critical ratio of entrance. From these measurements occupation size distribution curves and entrance size distribution curves can be drawn, analogous to particle size distribution curves. The results may be applied to the problem of the design of aggregate gradings to minimum or controlled void content, using premixing or filtration techniques, and to the related problem of segregation of mixed aggregates. SOIL-CEMENT SEEPAGE TEST SECTION LUBBOCK REGULATING RESERVOIR CANADIAN RIVER PROJECT, TEXAS,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
Glenn DeGroot.
Available from the National Technical Information Service as PB-198 136, $3.00 in paper copy, $0.95 in microfiche. Bur Reclam Rep REC-ERC-71-13, Feb 1971. 43 p, 40 fig, 4 tab, 2 ref, append.

Descriptors: *Soil cement, *Seepage, *Permeability, Cracks, Reservoirs, Hydraulic gradient, Texas, Reservoir leakage.
Identifiers: *Field tests, Thermal expansion, *Permeability tests, Seepage losses, Canadian River Project (Tex), Lubbock Regulating Rsvr (Tex).

A large-scale seepage test was performed on sections of soil-cement facing at Lubbock Regulating Reservoir in Texas. Two collection systems each covering about 1200 sq ft were built into the earth lining before the facing was constructed. Each collection system consisted of a butyl rubber sheet and sand blanket with a drainage pipe to collect the water and take it to a measurement tank. Seepage rates at unit gradient varied from 0.15 cu ft/sq ft/day at the beginning of the test to 0.002 cu ft/sq ft/day during the warmer months in 1968 to 1970. Rates increased to about 0.04 cu ft/sq ft/day during the colder months. Possible reasons for the decrease in seepage rates during the warmer months are: (1) closing of the shrinkage cracks; (2) algal growth in the cracks; and (3) temperature variation in the facing. A laboratory permeability test showed a considerably lower coefficient of permeability, indicating the most of the seepage in the test section was occurring along the cracks.

Available from the National Technical Information Service as AD-720 344, $3.00 in paper copy, $0.95 in microfiche. Naval Civil Engineering Laboratory Report CR-71.003, Dec 1970.

Descriptors: *Beds under water, *Oceans, *Earth-handling equipment, Structural properties, Soil mechanics, Mathematical models, *Dredging.

Identifiers: *Ocean bottom, Underwater vehicles, Deep submergence, Removal, Underwater equipment, Environmental tests, *Seafloor excavators, Underwater excavation, Underwater construction.

The system definition and analysis process through which a deep-ocean Seafloor Excavator is developed is described. Eight concepts are initially formulated and studied, with the three most practical being further developed. A comprehensive system and cost analysis of the three selected concepts is performed to determine the single, most effective concept. The preliminary design and the design specifications for this concept are developed. The resulting design is of a wide-tracked, remotely operated submersible vehicle equipped with a revolving, extendable (jackknife) dredging arm capable of performing earthmoving, excavating dredging tasks in waters as deep as 6000 feet. This report is comprised of four volumes: Volume I contains the summary, Volume II contains the preliminary design and specifications, Volume III contains the concept definition and system analysis studies conducted to establish the preliminary design requirements, and Volume IV contains supporting and supplemental data developed during the course of this program.

DEFORMATION OF ROCK FOUNDATIONS OF HIGH DAMS AFTER FILLING THE RESERVOIRS,
R. R. Tizdel.
Hydrotechnical Construction, No 6, p 512-519, June 1970. 8 p, 7 fig, 13 ref.

Descriptors: Dams, *Concrete dams, Rock foundations, *Dam foundations, *Deformation, Loads (Forces), Dam design, Large structures, Dam failure, Reservoir storage, Cracking, Cutoffs, Stress, Strain, Reservoirs, Settlement (Structural), Foreign research.
Identifiers: USSR.

Deep reservoirs formed by high dams and storing large amounts of water cause deformations in the rock masses making up the bottom and sides of the basins. The deformations, which depend on the water load and on the dimensions of the surfaces over which the load is distributed, alter the stress in the rocks to a considerable depth. The deformations extend beyond the perimeter of the reservoirs, forming broad depressions. Under these conditions, the dam is situated on the edge of the depression thus formed, with the foundation sloping toward the upper pool. In the case of high concrete dams, this may result in tensile stresses in the base in contact with the rock and in the section of the foundation near the contact, which may cause partial destruction of the contact, opening of cracks in the foundation, and fracture of the cutoff. Several examples of the effect of the weight of reservoir water on the deformation of dam foundations are discussed. (USBR)

UNDERGROUND ROCK STRUCTURES CHALLENGE THE ENGINEER,
Leeds, Hill and Jewett, Inc., San Francisco, Calif.
T. A. Lang.
Paper American Society of Civil Engineers National Water Resources Engineers, Phoenix, Ariz, Jan 1971. 20 p, 3 fig, 5 ref.

Descriptors: Rock excavation, *Rock foundations, Rock mechanics, *Rock properties, *Rock tests, Underground powerplants, Finite element method, Tunnel construction, *Tunnel design, Foundations, In situ tests, In situ rock, Foundation investigations, Laboratory tests, Mines, Computer applications, Elastic theory.
Identifiers: Bureau of Mines, Bureau of reclamation, Malpasset Dam, France.

Rock mechanics and engineering for rock construction have come a long way from being a qualitative art, and the design and construction of rock structures such as large excavations--either surface or underground--present a real challenge to the engineer. Techniques for investigating and determining within acceptable tolerances the rock conditions at a site are available, and reasonable analytical procedures have been developed. The engineer must correlate and meld the techniques and analytical procedures so that designs prepared for major engineering structures will ensure permanent stability and adequacy under specified conditions of usage. (USBR)

STRENGTH VS STRUCTURE: A STUDY FOR HYDRAULIC CEMENTS,
Carnegie-Mellon Univ., Pittsburgh, Pa.
E. M. Krokosky.
Materials and Structures, Vol 3, No 17, p 313-323, Sept-Oct 1970. 11 p, 19 fig, 1 tab, 21 ref.

Descriptors: *Molecular structure, *Concretes, Cements, Theory, Voids, Compressive strength, Bonding strength, *Concrete technology, Silicates, Tensile strength, Strength, *Electron microscopy, Capillarity, Porosity, *Portland cements, Water content, Water-Cement ratio, Bibliographies.
Identifiers: Hydraulic cement, Cement chemistry, Cement hydration, Cement paste.

A review of the present state-of-the-art in structure versus strength determinations for hydraulic cements is undertaken. Morphological and mechanical factors are discussed. New electron micrograph studies of the hydrated material at 800 kv are presented. Evidence shows that hydrated portland cement is potentially a very strong material. All data suggest that primary bond exists between the aggregations of hydrated material, but the existence of primary bonds is not consistent with the structure of hydrated material as presented in the literature. By using 1000-kv electron microscopes and microscan equipment, substantial breakthroughs will be made in the structure observation field. The mechanical testing field seems adequate in most respects. If the hydrated system consists primarily of strong primary bonds, some innovating thinking must be done to explain the nature of the strength of interactive bonds that could develop when these masses of hydrating material interact and interlock. (USBR)
W71-09063

CONTRIBUTION TO THE DETERMINATION OF THE SAFETY COEFFICIENT OF CONCRETE,
J. F. Orth.
Transl from French Bur Reclam Transl 725, Feb, 1971. 17 p, 9 fig, 18 ref. Schweizer Bauzeitung, Vol 88, No 43, p 965-970, Oct, 1970.

Descriptors: Concretes, Concrete properties, *Concrete tests, *Safety factors, *Concrete technology, Coefficients, Design, Criteria, Crushing, Compression tests, Structural behavior, Dams, Stress, Strain, Laboratory tests, Foreign research, Bibliographies.
Identifiers: *Microfissuration, Breaking strength.

The engineer responsible for designing a structure is faced with the dilemma of reconciling the economy and safety of the structure so that it may be economically profitable and at the same time satisfy the strictest stability guarantees. Nothing must be neglected to ensure the greatest possible safety in the design. Questions arise as to whether traditional concrete compression and tension tests are sufficient and still guarantee the allowed degree of safety, and whether stresses less than those occurring at the breaking point cause a predislocation of the most strained parts. R Peltier and H Ruesch observed that concrete cannot be strained without damage beyond a certain stress. This stress is smaller than the breaking point stress obtained by traditional tests. Therefore, the safety of a large concrete structure should not be evaluated on the basis of traditional tests but rather the strength corresponding to the microfissuration threshold. When the safety coefficient based on the microfissuration threshold is analyzed in comparison with the traditional coefficient, it is undeniable that the microfissuration threshold is based on superior experimental notions; the safety margin is narrower but more realistic. (USBR)

CONCRETE-POLYMER MATERIALS--THIRD TOPICAL REPORT,
Bureau of Reclamation, Denver, Colo.
J. T. Dikeou.
Bureau of Reclamation Report REC-ERC-71-6 and Brookhaven National Laboratory Report BNL 50275 (T-602), Jan 1971. 107 p, 49 fig, 52 tab, 10 ref.

Descriptors: Concrete mixes, Concrete pipes, Concrete tests, *Concrete technology, Impregnation, Research and development, Durability, *Polymer concretes, Materials engineering, Construction materials, Desalination plants, Composite materials, Polymers, Monomers, Concretes, Structural concrete, Concrete properties, Concrete products.
Identifiers: *Concrete-polymer materials, Concrete vessels.

Investigations of concrete-polymer materials as of June 1970 by a joint program of the Bureau of Reclamation, Brookhaven National Laboratory, Atomic Energy Commission, and Office of Saline Water are reported. Three materials being investigated are: (1) polymer-impregnated concrete (PIC - precast portland cement concrete impregnated by a monomer system which is subsequently polymerized in situ); (2) polymer-cement concrete (PCC - monomer is added during mixing of portland cement, water, and aggregate followed by polymerization); and (3) polymer concrete (PC - a composite formed by polymerizing a monomer and aggregate mixture). Investigations indicate that the most successful concrete polymer material for construction is PIC, but present studies are including PC and PCC because of potential applications if feasible fabrication methods can be developed. Compared to conventional concrete, PIC shows impressive improvements in strength and durability. Tests show that PIC made with ordinary concrete has essentially the same properties as PIC made with a more expensive high-strength concrete. Applications for PIC being investigated are desalting plants, drain tile, culvert and sewer pipe, beams and wall panels in housing, bridge decks, roads, luminaries, and underwater structures. (USBR)

THE ENGINEERING PROPERTIES OF MINE TAILINGS,
Bureau of Mines, Spokane, Wash.
H. C. Pettibone, and C. D. Kealy.
Paper, American Society of Civil Engineers, National Water Resources Engineering Phoenix, Ariz, Jan 1971. 27 p, 16 fig, 6 tab, 10 ref, append.

Descriptors: Mine wastes, *Construction materials, Highways, Physical properties, Earth dams, Environmental effects, Workability, Embankments, Gradation, Pervious soils, Cohesionless soils, Shear strength, Relative density, Stress-strain curves, Soil properties, Earth materials, Soil investigations, Soil mechanics, *Properties, Materials engineering.
Identifiers: *Tailings.

Because of more and more emphasis on the quality of our environment, consideration of using waste materials such as mine tailings instead of creating

new borrow pits for construction of highways and earth dams is becoming imperative. Some important engineering properties of mine tailings related to using the material for construction are presented. Mine tailings are manmade materials and have more uniform characteristics than most natural deposits. The desired gradation of materials from tailings can be obtained by using hydraulic cyclones or by selective excavation from tailings ponds. Mine tailings contain more minus No. 200 particles than might be expected for a good construction material; however, because of the particle shape and lack of colloidal particles, the material can contain more fines than normal and still be free draining and easily workable. Most mine tailings are cohesionless, compact easily, and have good shear strength. Sources of tailings can be found within economic haul distance of many construction sites. An example showing that mine tailings have been used successfully for a highway embankment, and a hypothetical case showing that tailings could be used to construct earth dams are presented. (USBR)
W71-09053

FRP: CORROSION'S LATEST ENEMY,
H. R. Clauser.
Iron Age, Vol 206, No 16, p 81-88, Oct 1970. 8 p, 6 fig, 2 tab.

Descriptors: Corrosion resistance, Electronic equipment, Nylon, Boats, Thermoplastic resins, Reinforced plastics, Tensile strength, Mechanical properties, *Reinforced plastic pipe, Research and development, *Pipes, *Plastics, Epoxy resins, Glass fibers, Electrical properties, Polyvinyl alcohol, *Glass reinforced plastics, Dies, Aircraft, Polyester resins.
Identifiers: Fiberglass plastic pipes, Automobile industry.

The use of fiber reinforced plastics (FRP) will increase at a faster pace than any other engineering material. Over the 3-year period, 1966-69, FRP output jumped an average of 27% per year, bringing the total value of molded FRP products up to about $650 million in 1969. Reasons for the past production boom in FRP are many, including: (1) extremely versatile composites, (2) lightweight with relatively high strength-to-weight ratios, and (3) excellent corrosion resistance. In addition, FRP can be economically formed into virtually any shape and size part. Altogether, about 35,000 different parts are being made in reinforced plastics. Presently, 22% of the total FRP production goes to the automobile industry; by 1975, use by this industry is expected to triple. Growth has been spectacular in the marine field; FRP now dominates construction of hulls from 14 to 50 ft in length. In commercial and private aircraft fields, fiber reinforced plastics are making steady gains. Pipe, probably the fastest growing segment of the market, is produced by continuous machine processes, and the resin and reinforcement can be tailored to meet specific service conditions. The applications of reinforced plastics are definitely in areas traditionally held by metals. (USBR)

8H. Rapid Excavation

THE TEST BORING OF WOHLMEYER TYPE 3.0 M DIAMETER TUNNEL BORING MACHINE (TBM-840),
M. Muta, and S. Fujimoto.
IHI Engineering Review, Vol 3, No 5, p 84-90, Sept 1970. 7 p, 12 fig, 1 tab.

Descriptors: *Boring machines, *Field tests, Test procedures, Tunnels, Rock excavation, Tunnel construction, Tunneling, Specifications, Curves, *Tunneling machines, Construction equipment, Performance, Construction methods, Boring.

Tests of a Wohlmeyer Boring Machine (TBM-840) designed to bore a 4-m-dia investigation tunnel through andesite were made to determine the capabilities of the machine and to develop methods for boring a double tunnel, S-shaped siding. Tests were conducted in hard, abrasive rhyolite. Specifications of the machine, rock properties and geology at the test site, and test procedures are presented. The first test was to bore a straight tunnel 4 m in diameter and 50 m long while measuring boring rate, cutter power, drum torque, and cutting thrust. Average speed of the boring was 0.55 m per hr, considered satisfactory in hard rhyolite. The second test was to bore a double tunnel, S-shaped siding with a radius of curvature of 150 m. The double section was advanced by boring two 4-m-dia overlapping tunnels with an eccentricity of 2 m. The boring machine could be steered nearly in accordance with the planned line. Conclusions are: (1) boring of double tunnels with the machine will be performed according to methods established in the tests; and (2) correcting yaw in straight boring and maintaining alignment for a curved tunnel axis can be attained easily. (USBR)

EXPERIMENTS IN ROCK CUTTING BY IMPACT METHODS,
Marwin Mining Tools Ltd., Rothley (England).
J. Furby.
Tunnels Tunnelling, Vol 2, No 6, p 359-365, Nov-Dec 1970. 6 p, 17 fig, 2 tab, 2 ref.

Descriptors: *Rock excavation, Rocks, Cutting, *Impact, Grooves, Test procedures, Excavation, Methodology, Rapid excavation, Laboratory tests, Research and development, Tunneling, Excavators, Foreign research.
Identifiers: *Cutters.

A test program to evaluate a method of cutting rock using a system of rigid tungsten carbide tipped flails called tines that cut by impact with the rock surface is described. Each tine is suspended freely on a steel pin. The pins are mounted on the periphery of a drum. By revolving the drum at high speed, each tine is flung outward to lie radial to the drum center. When the drum is moved toward the surface to be cut, each tine strikes the surface in turn. Concrete blocks made from one mix were cut to evaluate the effects of tine impact, depth of cut, direction or rotation, and power requirements for different tip shapes. Conclusions are: (1) moving the tine from the cut to the free surface is the preferred direction of rotation; (2) certain minimum tine velocity is required to obtain maximum-material removal; (3) cutting deep slots requires more energy than cutting shallow grooves; (4) tines cut effectively even with a cutting edge radius of 0.25 in.; (5) complete cutting of concrete is obtained with a tine spacing up to twice the tine width; and (6) tines cut cleanly through concrete and asphalt aggregates. Test results suggest that tines could be used advantageously for certain rock cutting applications when rock removal rather than rock production is required. (USBR)

DESIGN OF A WATER CANNON FOR ROCK TUNNELING EXPERIMENTS,
Terraspace, Inc, Bethesda, Md.
William C. Cooley, Franklin L. Beck, and Daniel L. Jaffe.
Available from the National Technical Information Service as PB-198 050, $3.00 in paper copy, $0.95 in microfiche. DOT-Office of High Speed Ground Transportation Report FRA-RT-71-70, Jan 15, 1971. 76 p. DOT-FR-00017.

Descriptors: *Tunneling, *Excavation, *Tunneling machines, Rock mechanics, *Jets, Rock excavation, Fractures.
Identifiers: *Hydraulic jets, Hydraulic servomechanisms, Pneumatic servomechanisms, *Water cannons.

A detailed design is presented for manufacturing a high pressure pulsed water cannon for rock-breaking experiments in a tunnel or quarry at jet pressures up to 106 psi. The test system includes a trailer for carrying the water cannon, and a separate dolly for the power system and controls. The water cannon incorporates components of a Terrapak hydro-pneumatic actuator and is designed to fire one pulse every 5 minutes, but can be modified to fire 20 pulses per minute with a pulse energy of 93,500 ft.lbs. This report covers the system analysis, design studies and detailed design of the water cannon system and discusses fabrication, operation and test procedures.

W71-08986 06E

AN ACT FOR A COMPREHENSIVE WATER AND RELATED LAND RESOURCES MANAGEMENT PROGRAM (THE ARKANSAS WATER PLAN).
W71-09201 06E

ADMINISTRATIVE AGENCIES
GRANTS FOR CONSTRUCTION OF TREATMENT WORKS.
W71-08980 06E

REGULATION OF PUBLIC USE OF RESERVOIR AREAS.
W71-08987 06E

OIL SPILL PREVENTION AND POLLUTION CONTROL.
W71-08995 06E

WATER AND ENVIRONMENTAL QUALITY IMPROVEMENT ACT OF 1970.
W71-09198 06E

GUIDELINES FOR AGENCY STATEMENTS ON PROPOSED FEDERAL ACTIONS AFFECTING THE ENVIRONMENT.
W71-09208 06E

ANIMAL SLAUGHTERING AND PROCESSING.
W71-09209 06E

ADMINISTRATIVE DECISIONS
FINANCIAL RESPONSIBILITY FOR OIL POLLUTION CLEANUP.
W71-09432 06E

AN ACT IN RELATION TO WATER SUPPLY, DRAINAGE, SEWAGE, POLLUTION, AND FLOOD CONTROL IN CERTAIN COUNTIES.
W71-09433 06E

WATER QUALITY STANDARDS (PROCEDURE FOR REVISION).
W71-09434 06E

TAXATION-POLLUTION CONTROL FACILITIES.
W71-09444 06E

ADMINISTRATIVE PROCEDURE ACT
WHO'S RESPONSIBLE FOR POLLUTION,
W71-08990 06E

ADOPTION OF PRACTICES
GUIDELINES FOR AGENCY STATEMENTS ON PROPOSED FEDERAL ACTIONS AFFECTING THE ENVIRONMENT.
W71-09208 06E

ADRIATIC SEA
HOLOCENE SEDIMENTATION IN THE STRAIT OF OTRANTO BETWEEN THE ADRIATIC AND IONIAN SEAS (MEDITERRANEAN),
W71-09101 02J

AEOLIAN SOILS
CONSOLIDATION CHARACTERISTICS OF SOME PLEISTOCENE PERIGLACIAL METASTABLE SOILS OF EAST KENT,
W71-09140 02G

LONGITUDINAL DUNES OF THE NORTHWESTERN EDGE OF THE SIMPSON DESERT, NORTHERN TERRITORY, AUSTRALIA, 1. GEOMORPHOLOGY AND GRAIN SIZE RELATIONSHIPS,

W71-09279 02J

PHREATIC VERSUS VADOSE METEORIC DIAGENESIS OF LIMESTONES EVIDENCE FROM A FOSSIL WATER TABLE,
W71-09316 02J

AERATION
EFFECTS OF CONTAMINANTS ON REAERATION RATES IN RIVER WATER,
W71-08944 05G

AERIAL PHOTOGRAPHY
AERIAL PHOTOGRAPHY OF OIL SLICKS,
W71-09046 05A

EVALUATING GEOLOGIC HAZARDS WITH MULTIBAND PHOTOGRAPHY,
W71-09304 07B

AGRICULTURAL CHEMICALS
FISH-TOXICITY PROBLEMS OF PESTICIDES IN JAPAN - THE PRESENT SITUATION AND THE POLICIES OF THE MINISTRY OF AGRICULTURE AND FORESTRY,
W71-09377 05A

AIR CIRCULATION
STUDY OF THE RELATIONSHIP BETWEEN ANNUAL RUNOFF OF RIVERS OF THE USSR AND ATMOSPHERIC CIRCULATION (RUSSIAN ISSLEDOVANIYE ZAVISIMOSTI GODOVOGO STOKA REK SSSR OT ATMOSFERNOY TSIRKULYATSII),
W71-09136 02A

AIR ENVIRONMENT
CARBON MONOXIDE IN RAINWATER,
W71-09105 02B

SOIL A NATURAL SINK FOR CARBON MONOXIDE,
W71-09297 02G

AIR POLLUTION
PREVENTION, CONTROL, AND ABATEMENT OF AIR AND WATER POLLUTION AT FEDERAL FACILITIES,
W71-08984 06E

COLLECTION OF STEAM-ELECTRIC GENERATING PLANT POLLUTION CONTROL DATA.
W71-08985 06E

SYMPOSIUM ON ENVIRONMENTAL LEAD CONTAMINATION, HELD ON DECEMBER 13-15, 1965.
W71-09264 05C

SOIL A NATURAL SINK FOR CARBON MONOXIDE,
W71-09297 02G

AN ACT IN REALTION TO PREVENTION AND ABATEMENT OF AIR, LAND AND WATER POLLUTION.
W71-09445 06E

AIR STRIPPING
AIR STRIPPING OF AMMONIA,
W71-09460 05D

ALABAMA
FRANCHISE TAX DEDUCTIONS FOR COST OF ANTI-POLLUTION DEVICES, SYSTEMS AND FACILITIES.
W71-09042 06E

STATE SALES TAX EXEMPTION FOR PROCEEDS FROM THE SALE OF ANTI POLLUTION DEVICES, MATERIALS, SYSTEMS AND FACILITIES.
W71-09064 06E

STATE CORPORATE INCOME TAX DEDUCTIONS FOR AMOUNTS INVESTED IN ANTI-POLLUTION DEVICES, SYSTEMS AND FACILITIES.
W71-09202 06E

AN ACT PROVIDING FOR TAXATION DEDUCTION OF COST OF POLLUTION ABATEMENT DEVICES.
W71-09203 06E

AN ACT PROVIDING FOR THE EXEMPTION OF STATE USE TAXATION OF POLLUTION ABATEMENT DEVICES OR FACILITIES.
W71-09204 06E

ENVIRONMENTAL IMPROVEMENT AUTHORITIES ACT OF 1969.
W71-09205 06E

AN ACT PROVIDING FOR THE INCORPORATION OF PUBLIC WATER, SEWER AND FIRE PROTECTION DISTRICTS.
W71-09206 06E

ALASKA
FIELD TESTS OF ICE PREVENTION TECHNIQUES,
W71-08976 04A

PATHWAYS OF TRACE ELEMENTS IN ARCTIC LAKE ECOSYSTEMS. PROGRESS REPORT, APRIL 15, 1970-APRIL 14, 1971,
W71-09190 05C

ALGAE
SHORELINE ALGAE OF WESTERN LAKE ERIE,
W71-09156 05C

FUTURE PROSPECTS OF ALGAE AND MAN,
W71-09157 05C

PHOTOSYNTHESIS IN THE ALGAE,
W71-09172 05C

HYPNODINIUM-LIKE ALGAL BLOOMS IN GEORGIA LAKES,
W71-09173 05C

THE ADHESIVE PROPERTIES OF 'CHLORELLA VULGARIS',
W71-09261 05C

MICRITIC ENVELOPES OF CARBONATE GRAINS ARE NOT EXCLUSIVELY OF PHOTOSYNTHETIC ALGAL ORIGIN,
W71-09287 02J

ALGAE CONTROL
UTILIZATION OF HERBIVOROUS FISH IN FISH MANAGEMENT AND MELIORATION OF WATER BASINS, (IN RUSSIAN).
W71-09163 05G

ALGAE HARVESTING
WATER RECLAMATION AND ALGAE HARVESTING,
W71-08951 05D

ALGAL SPECIES
SHORELINE ALGAE OF WESTERN LAKE ERIE,
W71-09156 05C

ALGICIDES
EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

ALLUVIAL CHANNELS
SEEPAGE EFFECT ON CHANNEL BANK STABILITY,
W71-09110 04A

SKEWNESS AS AN ENVIRONMENTAL INDICATOR IN THE SOLANI RIVER SYSTEM, ROORKEE (INDIA),
W71-09123 02J

ESTIMATING MEAN-ANNUAL RUNOFF USING CHANNEL GEOMETRY MEASUREMENTS,
W71-09313 04A

ALTERNANTHERA PHILOXEROIDES
PRODUCTION, MINERAL NUTRIENT ABSORPTION, AND BIOCHEMICAL ASSIMILATION BY JUSTICIA AMERICANA AND ALTERNANTHERA PHILOXEROIDES,
W71-09178 05C

ALUM
RE-USE AND DISPOSAL OF ALUM AND LIME SLUDGES,
W71-09455 05D

ALUMINUM
PHOSPHORUS REMOVAL BY ALUM AND IRON CLARIFICATION,
W71-09453 05D

AMMONIA
AIR STRIPPING OF AMMONIA,
W71-09460 05D

REMOVAL OF AMMONIA BY SELECTIVE ION EXCHANGE,
W71-09461 05D

NITROGEN REMOVAL BY BREAKPOINT CHLORINATION,
W71-09462 05D

OTHER METHODS OF AMMONIA REMOVAL,
W71-09463 05D

AMMONIA STRIPPING AT WASHINGTON D.C.
W71-09464 05D

AMMONIA STRIPPING
SIMULATION OF AMMONIA STRIPPING FROM WASTE WATER,
W71-08998 05D

AMMONIA STRIPPING AT WASHINGTON D.C.
W71-09464 05D

ANAEROBIC CONDITIONS
ROTATING BIOLOGICAL CONTACTORS FOLLOWING ANEROBIC LAGOONS,
W71-08943 05D

ANAEROBIC DIGESTION
ANAEROBIC STABILIZATION OF POTATO PROCESSING WASTES AS AFFECTED BY ORGANIC LOADING RATE,
W71-08959 05D

EFFECTS OF CARBONATE AND MAGNESIUM ON CALCIUM PHOSPHATE PRECIPITATION,
W71-09294 05D

ANAEROBIC PROCESSES
BIOCHEMISTRY AND PHYSIOLOGY OF DENITRIFICATION BY MARINE BACTERIA,
W71-09262 05D

ANALOG COMPUTERS
SIMULATION OF WATER RESOURCE REGIMES,
W71-08974 06A

ANALYTICAL TECHNIQUES
LOW AMBIENT LEVEL UPTAKE OF 14C-DDT BY THREE SPECIES OF MARINE PHYTOPLANKTON,
W71-09035 05A

MICRO-RESPIROMETRY AND EMULSIFIER TOXICITY,
W71-09045 05C

IDENTIFICATION OF MS-222 RESIDUES IN SELECTED FISH TISSUES BY THIN LAYER CHROMATOGRAPHY,
W71-09048 05A

A NEW TECHNIQUE FOR RELIABILITY CALCULATIONS,
W71-09073 06A

APPLICATION OF ASSOCIATION-ANALYSIS TO DISTRIBUTION STUDIES

OF RECENT FORAMINIFERA,
W71-09177 05A

SELF-OPERATED PIPETTE FOR GRAIN-SIZE ANALYSIS A PROTOTYPE,
W71-09318 07B

AN ELECTRODE CHAMBER FOR RECORDING RESPIRATORY AND OTHER MOVEMENTS OF FREE-SWIMMING ANIMALS,
W71-09372 05C

CARBAMATE BIOASSAY USING DAPHNIA MAGNA,
W71-09373 05A

ANESTHETICS
IDENTIFICATION OF MS-222 RESIDUES IN SELECTED FISH TISSUES BY THIN LAYER CHROMATOGRAPHY,
W71-09048 05A

DYNAMICS OF MS-222 IN THE BLOOD AND BRAIN OF FRESHWATER FISHES DURING ANETHESIA,
W71-09049 05C

EFFECT OF MS-222 ON ELECTROLYTE AND WATER CONTENT IN THE BRAIN OF RAINBOW TROUT,
W71-09050 05C

ANGLE OF REPOSE(SEDIMENTS)
EXPERIMENTS ON THE ANGLES OF REPOSE OF GRANULAR MATERIALS,
W71-09314 02J

ANIMAL POPULATIONS
ECOLOGICAL SCIENCES DIVISION ANNUAL PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1970.
W71-09194 05C

ANIMALS
ANIMAL SLAUGHTERING AND PROCESSING.
W71-09209 06E

ANION EXCHANGE
ALTERNATIVE METHODS FOR PHOSPHORUS REMOVAL,
W71-09454 05D

AQUACULTURE
SYSTEMS OF ENGINEERING AND DEVELOPMENT OF COMMERCIALLY VALUABLE MARINE RESOURCES IN THE DELAWARE REGION,
W71-09259 02L

AQUATIC ALGAE
TEMPERATURE EFFECTS ON THE SORPTION OF RADIONUCLIDES BY FRESHWATER ALGAE,
W71-09250 05C

SOME OBSERVATIONS ON ALGAE INVADING A CESIUM-137 CONTAMINATED POND,
W71-09256 05C

AQUATIC ANIMALS
RADIONUCLIDE CYCLING IN AQUATIC ECOSYSTEMS,
W71-09011 05C

AQUATIC ENVIRONMENT
ECOLOGICAL STUDIES OF RADIOACTIVITY IN THE COLUMBIA RIVER ESTUARY AND ADJACENT PACIFIC OCEAN. PROGRESS REPORT, JULY 1, 1968-JUNE 30, 1969. PART B, BIOLOGICAL ASPECTS.
W71-09191 05C

LAKE ERIE COMMON EFFORT CAN SAVE IT.
W71-09387 05C

AQUATIC ENVIRONMENTS
EFFECTS OF INCREASED TEMPERATURE ON COLD-WATER ORGANISMS,
W71-08950 05C

AQUATIC HABITATS
ECOLOGICAL SCIENCES DIVISION ANNUAL PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1970.
W71-09194 05C

AQUATIC INSECTS
EFFECT OF WATER TEMPERATURE ON NYMPHAL FEEDING RATE, EMERGENCE, AND ADULT LONGEVITY OF THE STONEFLY PTERONARCYS DORSATA,
W71-08977 05C

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-08978 05C

STUDIES ON ZINC IN FRESHWATER ECOSYSTEMS,
W71-09005 05C

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-09370 05C

AQUATIC LIFE
STUDY OF THE MANGANESE CYCLE IN FRENCH WATERS AND IN BRINE USING MN-54,
W71-09019 05C

A COMPUTER BASED FLORISTIC ANALYSIS OF PAMLICO RIVER PHYTOPLANKTON,
W71-09211 05A

AQUATIC MICROORGANISMS
INTERACTION OF PESTICIDES WITH AQUATIC MICROORGANISMS AND PLANKTON,
W71-09381 05C

AQUATIC PLANTS
STUDIES ON ZINC IN FRESHWATER ECOSYSTEMS,
W71-09005 05C

RADIONUCLIDE CYCLING IN AQUATIC ECOSYSTEMS,
W71-09011 05C

A GUIDE TO AQUATIC SMARTWEEDS (POLYGONUM) OF THE UNITED STATES,
W71-09151 05G

PRODUCTION, MINERAL NUTRIENT ABSORPTION, AND BIOCHEMICAL ASSIMILATION BY JUSTICIA AMERICANA AND ALTERNANTHERA PHILOXEROIDES,
W71-09178 05C

A PLASTIC BARRIER FOR SPOT TREATMENT OF AQUATIC VEGETATION,
W71-09179 05C

COEFFICIENTS OF ACCUMULATION OF THE RADIOISOTOPE IRON-59 BY CERTAIN SPECIES OF FRESH WATER PLANTS,
W71-09180 05C

AQUATIC PRODUCITIVITY
SYSTEMS OF ENGINEERING AND DEVELOPMENT OF COMMERCIALLY VALUABLE MARINE RESOURCES IN THE DELAWARE REGION,
W71-09259 02L

AQUATIC WEEDS
A GUIDE TO AQUATIC SMARTWEEDS (POLYGONUM) OF THE UNITED STATES,
W71-09151 05G

AQUEOUS SOLUTIONS
INFLUENCE OF VOLCANIC ROCKS ON THE COMPOSITION OF HYDROTHERMAL SOLUTIONS (RUSSIAN VLIYANIYE VULKANOGENNYKH POROD NA SOSTAV GIDROTERMAL'NYKH RASTVOROV),
W71-09120 02K

AQUIFER CHARACTERISTICS
GEOLOGY AND GROUNDWATER RESOURCES OF TRAILL COUNTY PART 3 GROUNDWATER RESOURCES,
W71-09090 02F

RECORDS OF PRECIPITATION, WATER LEVELS AND GROUNDWATER RECHARGE TO THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1970,
W71-09111 02F

A PRELIMINARY EVALUATION OF BANK STORAGE ASSOCIATED WITH LIBBY RESERVOIR IN NORTHWESTERN MONTANA,
W71-09137 03B

GROUNDWATER DATA AS OF 1967--COLORADO DESERT SUBREGION, CALIFORNIA,
W71-09142 07C

SUMMARY OF THE GROUNDWATER DATA AS OF 1967--CALIFORNIA REGION,
W71-09143 02F

GROUNDWATER DATA AS OF 1967--NORTH COASTAL SUBREGION, CALIFORNIA,
W71-09144 07C

GROUNDWATER DATA AS OF 1967--SOUTH LAHONTAN SUBREGION, CALIFORNIA,
W71-09145 07C

GROUNDWATER DATA AS OF 1967--NORTH LAHONTAN SUBREGION, CALIFORNIA,
W71-09146 07C

GROUNDWATER DATA AS OF 1967--SAN JOAQUIN BASIN SUBREGION, CALIFORNIA,
W71-09147 07C

GROUNDWATER DATA AS OF 1967--SACRAMENTO BASIN SUBREGION, CALIFORNIA,
W71-09148 07C

AQUIFERS
GOUNDWATERS OF THE MANGYSHLAK-UST URT OIL-AND GAS-BEARING REGION (RUSSIAN PODZEMNYYE VODY MANGYSHLAK-USTYURTSKOY NEFTEGAZONOSNOY PROVINTSII),
W71-09135 04B

HYDRAULIC TESTING OF WELL HTH-23 IN CENTRAL NEVADA,
W71-09324 02F

HYDRAULIC TESTING OF WELL HTH-4 IN CENTRAL NEVADA,
W71-09325 02F

HYDRAULIC TESTING OF WELL HTH-3 IN CENTRAL NEVADA,
W71-09326 02F

HYDRAULIC TESTING OF WELL HTH-5 IN CENTRAL NEVADA,
W71-09327 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-1, IN CENTRAL NEVADA,
W71-09328 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-2, IN CENTRAL NEVADA,
W71-09329 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-3, IN CENTRAL NEVADA,
W71-09330 02F

HYDRAULIC TESTING OF WELL HTH-21-1 IN CENTRAL NEVADA,

W71-09331 02F

ARCH DAMS
CALCULATION OF THE FOUNDATION OF ARCH DAMS,
W71-09071 08A

ARIZONA
DEPLETION OF STREAMFLOW BY INFILTRATION IN THE MAIN CHANNELS OF THE TUCSON BASIN, SOUTHEASTERN ARIZONA,
W71-09139 02F

ARKANSAS
REGULATION OF DRILLING FOR AND DISPOSAL OF SALT WATER.
W71-09031 06E

AN ACT TO PROHIBIT THE SURFACE DISCHARGING SALTWATER ON THE SURFACE OF LANDS TO PROHIBIT TAX DEDUCTIONS TO THOSE WHO DISCHARGE SALTWATER AND FOR OTHER PURPOSES.
W71-09040 06E

FLOOD PLAIN INFORMATION ON DAYS CREEK AND TRIBUTARIES AT TEXARKANA, ARKANSAS-TEXAS.
W71-09114 04A

AN ACT FOR A COMPREHENSIVE WATER AND RELATED LAND RESOURCES MANAGEMENT PROGRAM (THE ARKANSAS WATER PLAN).
W71-09201 06E

ARTIFICAL RECHARGE
OBSERVATIONS ON WATER CONTENT CHANGES IN STRATIFIED SEDIMENTS DURING PIT RECHARGE,
W71-09301 04B

ARTIFICIAL PRECIPITATION
LARGE SCALE EFFECTS OF CLOUD SEEDING. 1969-70 SEASON AND TWO YEAR SUMMARY,
W71-09265 03B

ASSESSMENTS
AN ACT PROVIDING FOR TAXATION DEDUCTION OF COST OF POLLUTION ABATEMENT DEVICES.
W71-09203 06E

ASSIMILATION
AN ASSESSMENT OF THE ASSIMILATION OF ELEMENTAL PHOSPHOROUS BY NEWFOUNDLAND MARINE ORGANISMS IN THE 1969 POLLUTION PROBLEM AND IN 1970 MONITORING OPERATIONS,
W71-09384 05A

ASSOCIATION ANALYSIS
APPLICATION OF ASSOCIATION-ANALYSIS TO DISTRIBUTION STUDIES OF RECENT FORAMINIFERA,
W71-09177 05A

ASTRAKHAN' OBLAST
IRRIGATION AND UTILIZATION OF IRRIGATED LANDS IN THE ASTRAKHAN' OBLAST (RUSSIAN OROSHENIYE I ISPOL'ZOVANIYE OROSHAYEMYKH ZEMEL' V ASTRAKHANSKOY OBLASTI),
W71-09133 03F

ATLANTIC OCEAN
DOSE ESTIMATION STUDIES RELATED TO PROPOSED CONSTRUCTION OF AN ATLANTIC-PACIFIC INTEROCEANIC CANAL WITH NUCLEAR EXPLOSIVES PHASE III,
W71-09238 05B

ATMOSPHERE
TRITIUM INJECTION AND CONCENTRATION DISTRIBUTION IN THE ATMOSPHERE,
W71-09033 05B

ATMOSPHERIC PHYSICS
NIMBUS WEATHER SATELLITES REMOTE SOUNDING OF THE ATMOSPHERE,
W71-09271 07B

AUSTIN(TEX)
ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1969,
W71-09086 07C

AUTOMATIC CONTROL
AUTO-MECHANIZATION OF PIPE DISTRIBUTION SYSTEMS,
W71-09068 03F

AUTO-MECHANIZATION OF OPEN CHANNEL DISTRIBUTION SYSTEMS,
W71-09069 03F

WATER, WATER EVERYWHERE,
W71-09412 05A

AUTOMATION
SELF-OPERATED PIPETTE FOR GRAIN-SIZE ANALYSIS A PROTOTYPE,
W71-09318 07B

AVALANCHES
EXPERIMENTS ON THE ANGLES OF REPOSE OF GRANULAR MATERIALS,
W71-09314 02J

BACTERIA
BIOCHEMISTRY AND PHYSIOLOGY OF DENITRIFICATION BY MARINE BACTERIA,
W71-09262 05D

BACTERIAL DENSITY
TOXICITY OF SEA WATER TO COLIFORM BACTERIA,
W71-08946 05A

BACTERICIDES
EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

BACTERIOLOGICAL ANALYSES
WASTE WATER FROM SIMIAN PRIMATE FACILITIES,
W71-08949 05D

BALTIC SEA
STAGNANT SEA,
W71-09415 05B

BANK STABILITY
SEEPAGE EFFECT ON CHANNEL BANK STABILITY,
W71-09110 04A

BANK STORAGE
A PRELIMINARY EVALUATION OF BANK STORAGE ASSOCIATED WITH LIBBY RESERVOIR IN NORTHWESTERN MONTANA,
W71-09137 03B

BARLEY
RAINFALL USE EFFICIENCY FOR DRYLAND BARLEY WITH THREE CROP AND WATER MANAGEMENT SYSTEMS,
W71-08975 03F

BARNACLES
THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
W71-09044 05C

BARRIERS
CONCEPT DEVELOPMENT OF A HEAVY DUTY OIL CONTAINMENT SYSTEM FOR USE ON THE HIGH SEAS.
W71-09367 05D

BASE FLOW
RAINFALL-RUNOFF-HYDROGRAPH RELATIONS FOR NORTHERN LOUISIANA,
W71-09087 02A

BASINS
THE PERCH LAKE EVAPORATION STUDY - THE USE OF RADIOISOTOPES IN HYDROLOGY, FEBRUARY 1970, VIENNA, AUSTRIA.
W71-09032 05B

BASS
EFFECTS OF LIMNOLOGICAL FACTORS ON UPTAKE OF CESIUM-137 FALLOUT BY FISH. TECHNICAL PROGRESS REPORT, JUNE 1969-FEB. 1970,
W71-09186 05C

BAYS
EUTROPHICATION OF SHELTERED BAYS IN A LARGE LAKE,
W71-09150 05C

BEACH EROSION
NET KINETIC ENERGY IN LITTORAL TRANSPORT,
W71-09298 02J

BEACHES
SIGNIFICANCE OF PEBBLE SIZE AND SHAPE IN SORTING BY WAVES,
W71-09124 02J

COASTAL REGIME - RECENT U. S. EXPERIENCE,
W71-09141 08B

A COARSE-GRAINED POCKET BEACH COMPLEX, TANAFJORD (NORWAY),
W71-09282 02J

BEDS
BEHAVIOR OF POROUS BED NEAR FLOW SINGULARITY,
W71-09108 02G

BEDS UNDER WATER
THE SEAFLOOR EXCAVATOR, VOLUME IV. APPENDICES,
W71-09359 08D

BELORUSSIA
LAND RECLAMATION AND COMPLEX USE OF WATER RESOURCES (RUSSIAN MELIORATSIYA ZEMEL' I KOMPLEKSNOYE ISPOL' ZOVANIYE VODNYKH RESURSOV),
W71-09134 04A

BENEFICIAL USE
HEATED EFFLUENT - AN ASSET TO AGRICULTURE,
W71-09028 05C

BENEFIT-COST ANALYSIS
ESTIMATION DEVIATIONS THEIR EFFECT UPON THE BENEFIT-COST RATIO,
W71-09059 06B

BENEFIT-COST RATIOS
ESTIMATION DEVIATIONS THEIR EFFECT UPON THE BENEFIT-COST RATIO,
W71-09059 06B

BENTHOS
A MULTIPLE CORER FOR SAMPLING PROFUNDAL BENTHOS,
W71-09158 05A

BERMUDA
PHREATIC VERSUS VADOSE METEORIC DIAGENESIS OF LIMESTONES EVIDENCE FROM A FOSSIL WATER TABLE,
W71-09316 02J

BIBLIOGRAPHIES
BIOENVIRONMENTAL AND RADIOLOGICAL-SAFETY FEASIBILITY STUDIES, ATLANTIC-PACIFIC INTEROCEANIC CANAL, BIBLIOGRAPHY,
W71-09006 05C

A PRELIMINARY BIBLIOGRAPHY OF MATHEMATICAL MODELING IN ECOLOGY,

W71-09025 05C

PERSISTENT PESTICIDES IN THE ENVIRONMENT,
W71-09088 05B

THE STUDY OF THE PHYSICAL, CHEMICAL AND BIOLOGICAL NATURE OF WATER QUALITY UNDER UTAH CONDITIONS,

THE EFFECT OF SIZE ON THE UPTAKE OF DDT FROM WATER BY FISH,
W71-09389 05C

EFFECTS OF SALINITY ON UPTAKE OF DDT, DDE AND DDD BY FISH.
W71-09390 05C

CHLORINATION
NITROGEN REMOVAL BY BREAKPOINT CHLORINATION,
W71-09462 05D

CHORELLA
THE ADHESIVE PROPERTIES OF 'CHLORELLA VULGARIS',
W71-09261 05C

CHROMATOGRAPHY
IDENTIFICATION OF MS-222 RESIDUES IN SELECTED FISH TISSUES BY THIN LAYER CHROMATOGRAPHY,
W71-09048 05A

CHRONIC POLLUTION
THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,
W71-09043 05C

THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
W71-09044 05C

CIRCULATION(ANIMALS)
EFFECTS OF HYPOXIA UPON RESPIRATION AND CIRCULATION IN THE DOGFISH SCYLIORHINUS STELLARIS,
W71-09375 05C

CITIES
HEINZ V BOROUGH OF ESSEX FELLS (CITY'S LIABILITY FOR DISCHARGING OIL INTO STREAM).
W71-08996 06E

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1969,
W71-09086 07C

WAGNER V TOWN OF CONOVER (CITY'S LIABILITY FOR DISCHARGE OF SEWAGE INTO STREAM).
W71-09233 06E

CITY OF BARNESVILLE V PARHAM (CITY'S LIABILITY FOR DISCHARGING SEWAGE INTO OPEN STREAM).
W71-09244 06E

WELLS V SHEETS (CITY'S LIABILITY FOR LANDOWNERS POLLUTING DITCH NOT PART OF THE CITY'S DRAINAGE SYSTEM).
W71-09371 06E

CONESTEE MILLS V CITY OF GREENVILLE (CITY'S LIABILITY TO LOWER RIPARIAN OWNER FOR SEWAGE DISCHARGE).
W71-09383 06E

ANGLIN V CITY OF BROCKTON (MUNICIPAL LIABILITY FOR PROPERTY DAMAGES DUE TO RIVER OVERFLOW).
W71-09397 06E

CLAMS
EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

CLAY MINERALS
EXPERIMENTAL STUDY OF THE SORPTION OF POTASSIUM BY MONTMORILLONITE,
W71-09319 02J

CLAYS
SOLUTES IN PRESSURE MEMBRANE FILTRATES OF SEVERAL CLAY-WATER ELECTROLYTE SYSTEMS,
W71-09116 02G

EFFECT OF CLAY ON THE ACCURACY OF THE HYDROMETER METHOD,
W71-09284 07B

CLEAN AIR ACT
PREVENTION, CONTROL, AND ABATEMENT OF AIR AND WATER POLLUTION AT FEDERAL FACILITIES,
W71-08984 06E

CLEAN LAKES ACT
CLEAN LAKES ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT).
W71-08992 06E

CLEANING
CONCEPT DEVELOPMENT OF A HEAVY DUTY OIL CONTAINMENT SYSTEM

FOR USE ON THE HIGH SEAS.
W71-09367 05D

CLIMATIC DATA
LONG-RANGE FORECASTING OF ICE BREAKUP ON RIVERS OF THE SEVERNYY KRAY (RUSSIAN VSKRITIYE REK SEVERNOGO KRAYA I METODIKA YEGO DOLGOSROCHNOGO PROGNOZA),
W71-09126 02C

A LONG-RANGE FORECAST OF WATER FLOW TO LARGE LAKES OF THE LADOGA BASIN (RUSSIAN DOLGOSROCHNYY PROGNOZ PRITOKA VODY V KRUPNYYE OZERA LADOZHSKOGO BASSEYNA),
W71-09129 04B

CLIMATOLOGY
METEOROLOGY IN AGRICULTURAL PLANNING,
W71-09428 03F

CLOUD SEEDING
LARGE SCALE EFFECTS OF CLOUD SEEDING. 1969-70 SEASON AND TWO YEAR SUMMARY,
W71-09265 03B

COAL MINE WASTES
ACID MINE DRAINAGE (INDUSTRY ATTEMPTS TO DESCRIBE AND SOLVE POLLUTION PROBLEMS).
W71-09439 05G

COAL TAR COATING
HYPERPLASIA IN AN ESTUARINE BRYOZOAN ATTRIBUTABLE TO COAL TAR DERIVATIVES,
W71-09036 05C

COASTAL ENGINEERING
COASTAL REGIME - RECENT U. S. EXPERIENCE,
W71-09141 08B

COASTAL MARSHES
THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,

W71-09212 05C

AN ELECTRODE CHAMBER FOR RECORDING RESPIRATORY AND OTHER MOVEMENTS OF FREE-SWIMMING ANIMALS,
W71-09372 05C

EFFECTS OF HYPOXIA UPON RESPIRATION AND CIRCULATION IN THE DOGFISH SCYLIORHINUS STELLARIS,
W71-09375 05C

EFFECT OF SESAMEX ON BRAIN ACETYLCHOLINESTERASE INHIBITION BY PARATHION IN FISHES,
W71-09378 05C

CHRONIC ENDRIN POISONING IN GOLDFISH, CARASSIUS AURATUS,
W71-09388 05C

EFFECTS OF SALINITY ON UPTAKE OF DDT, DDE AND DDD BY FISH.
W71-09390 05C

FISH POPULATIONS
LAKE ERIE COMMON EFFORT CAN SAVE IT.
W71-09387 05C

FISH TOXINS
EFFECTS OF CADMIUM, ZINC, MANGANESE AND CALCIUM ON OXYGEN AND PHOSPHATE METABOLISM OF BLUEGILL LIVER MITROCHONDRIA,
W71-08955 05C

FISHERIES
LAKE ERIE COMMON EFFORT CAN SAVE IT.
W71-09387 05C

LAKE ERIE ALIVE BUT CHANGING,
W71-09409 05B

FISHKILL
JAMES RIVER-WILSON CREEK STUDY, SPRINGFIELD, MISSOURI.
W71-09154 05C

REPORT ON A FISH KILL AT LAGUNA JOYUDA, WESTERN PUERTO RICO, IN THE SUMMER, 1967,
W71-09376 05C

AN ASSESSMENT OF THE ASSIMILATION OF ELEMENTAL PHOSPHOROUS BY NEWFOUNDLAND MARINE ORGANISMS IN THE 1969 POLLUTION PROBLEM AND IN 1970 MONITORING OPERATIONS,
W71-09384 05A

1969 FISH KILLS CAUSED BY POLLUTION (STATISTICAL REPORT).
W71-09441 05B

FISHKILLS
FISH TOLERANCE TO DISSOLVED NITROGEN,
W71-08960 05C

FLASHOVER
APPLICATION OF DIMENSIONAL ANALYSIS TO FLASHOVER CHARACTERISTICS OF POLLUTED INSULATORS,
W71-09062 08C

FLOOD CONTROL
FIELD TESTS OF ICE PREVENTION TECHNIQUES,
W71-08976 04A

COMPREHENSIVE PLANNING IN THE SOUTHEAST,
W71-09418 06B

FLOOD DAMAGE
FLOOD PLAIN INFORMATION ON DAYS CREEK AND TRIBUTARIES AT TEXARKANA, ARKANSAS-TEXAS.
W71-09114 04A

FLOOD PLAIN INFORMATION-CAPE FEAR RIVER AND CROSS CREEK WATERSHED, FAYETTEVILLE, NORTH CAROLINA.
W71-09115 04A

PRELIMINARY REPORT ON WIND-TIDE FLOODING IN NEW HANOVER COUNTY, NORTH CAROLINA.
W71-09335 04A

FLOOD PLAIN INFORMATION, WILLAMETTE RIVER, JOHNSON, KELLOGG, AND MT. SCOTT CREEKS, MILWAUKIE-OAK GROVE-LAKE OSWEGO, OREGON.
W71-09336 04A

FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, HURON RIVER, NORWALK CREEK, OHIO.
W71-09337 04A

FLOOD PLAIN INFORMATION, QUACHITA RIVER, BAYOU LAFOURCHE AND TRIBUTARIES, MONROE, LOUISIANA.
W71-09338 04A

SPECIAL FLOOD HAZARD INFORMATION REPORT ON ECONLOCKHATCHEE RIVER, ORANGE AND SEMINOLE COUNTIES, FLORIDA.
W71-09339 04A

FLOOD PLAIN INFORMATION, VERMILION RIVER, SKELLENGER CREEK, AND BONNEY CREEK, OHIO.
W71-09340 04A

ANGLIN V CITY OF BROCKTON (MUNICIPAL LIABILITY FOR PROPERTY DAMAGES DUE TO RIVER OVERFLOW).
W71-09397 06E

FLOOD PLAIN INSURANCE
A FLOOD INSURANCE MODEL FOR SHARING THE COSTS OF FLOOD PROTECTION,
W71-09402 04A

FLOOD PLAINS
FLOOD PLAIN INFORMATION, QUACHITA RIVER, BAYOU LAFOURCHE AND TRIBUTARIES, MONROE, LOUISIANA.
W71-09338 04A

FLOOD PROTECTION
DETERMINATION OF CHANNEL CAPACITY OF THE FRESNO RIVER DOWNSTREAM FROM HIDDEN DAMSITE, MADERA COUNTY, CALIFORNIA,
W71-09092 08B

FLOOD ROUTING
DETERMINATION OF CHANNEL CAPACITY OF THE FRESNO RIVER DOWNSTREAM FROM HIDDEN DAMSITE, MADERA COUNTY, CALIFORNIA,
W71-09092 08B

FLOODING
CHRISTIE V SANITARY DISTRICT OF CHICAGO (LIABILITY FOR EXCESSIVE DISCHARGE OF WATER).
W71-09395 06E

FLOODS
FLOOD PLAIN INFORMATION ON DAYS CREEK AND TRIBUTARIES AT TEXARKANA, ARKANSAS-TEXAS.
W71-09114 04A

FLOOD PLAIN INFORMATION-CAPE FEAR RIVER AND CROSS CREEK WATERSHED, FAYETTEVILLE, NORTH CAROLINA.
W71-09115 04A

MILLER V MOBILE AND OHIO RR (INADEQUATE DRAIN BENEATH RAILROAD EMBANKMENT).
W71-09162 06E

PRELIMINARY REPORT ON WIND-TIDE FLOODING IN NEW HANOVER COUNTY, NORTH CAROLINA.
W71-09335 04A

FLOOD PLAIN INFORMATION, WILLAMETTE RIVER, JOHNSON, KELLOGG, AND MT. SCOTT CREEKS, MILWAUKIE-OAK GROVE-LAKE OSWEGO, OREGON.
W71-09336 04A

FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, HURON RIVER, NORWALK CREEK, OHIO.
W71-09337 04A

FLOOD PLAIN INFORMATION, QUACHITA RIVER, BAYOU LAFOURCHE AND TRIBUTARIES, MONROE, LOUISIANA.
W71-09338 04A

SPECIAL FLOOD HAZARD INFORMATION REPORT ON ECONLOCKHATCHEE RIVER, ORANGE AND SEMINOLE COUNTIES, FLORIDA.
W71-09339 04A

FLOOD PLAIN INFORMATION, VERMILION RIVER, SKELLENGER CREEK, AND BONNEY CREEK, OHIO.
W71-09340 04A

FLORIDA
OIL SPILL PREVENTION AND POLLUTION CONTROL.
W71-08995 06E

AN ACT RELATING TO SANITARY SEWAGE DISPOSAL UNITS OCEAN OUTFALL AND DISPOSAL WELL TREATMENT REQUIREMENTS.
W71-08999 06E

THE OFFSET COURSE OF THE ST. JOHNS RIVER, FLORIDA,
W71-09309 02J

PRELIMINARY EVALUATION OF THE HYDROLOGIC EFFECTS OF IMPLEMENTING WATER AND SEWERAGE PLANS, DADE COUNTY, FLORIDA,
W71-09334 06D

SPECIAL FLOOD HAZARD INFORMATION REPORT ON ECONLOCKHATCHEE RIVER, ORANGE AND SEMINOLE COUNTIES, FLORIDA.
W71-09339 04A

GIBSON V CITY OF TAMPA (DISCHARGE OF MUNICIPAL SEWAGE INTO COASTAL WATERS).
W71-09447 06E

FLOTATION
PYRITE DEPRESSION BY REDUCTION OF SOLUTION OXIDATION POTENTIAL.
W71-09078 05D

FLOW
A LONG-RANGE FORECAST OF WATER FLOW TO LARGE LAKES OF THE LADOGA BASIN (RUSSIAN DOLGOSROCHNYY PROGNOZ PRITOKA VODY V KRUPNYYE OZERA LADOZHSKOGO BASSEYNA),
W71-09129 04B

FILLING AND EMPTYING SYSTEMS, MILLERS FERRY AND JONES BLUFF LOCKS, ALABAMA RIVER, ALABAMA. HYDRAULIC MODEL INVESTIGATION,
W71-09351 08B

DROP STRUCTURES FOR WALNUT CREEK PROJECT, WALNUT CREEK, CALIFORNIA. HYDRAULIC MODEL INVESTIGATION,
W71-09354 08B

NAVIGATION CONDITIONS AT LOCKS AND DAM NO. 4 MONONGAHELA RIVER, PENNSYLVANIA,
W71-09359 08A

NAVIGATION CONDITIONS AT BELLEVILLE LOCKS AND DAM, OHIO RIVER,
W71-09360 08B

OW AUGMENTATION
VALUATION OF FLOW AUGMENTATION RELEASES,
W71-09000 05G

OW CHARACTERISTICS
UTILITY OF RADIOISOTOPE METHODOLOGY IN ESTUARY POLLUTION CONTROL STUDIES,
W71-09257 05C

OW MEASUREMENT
RADIOISOTOPES AWD TURBINE FLOW MEASUREMENTS,
W71-09066 07B

OW PROFILES
CALCULATING MAXIMUM ICE JAM LEVELS OF THE NEVA RIVER (RUSSIAN RASCHET MAKSIMAL'NYKH ZAZHORNYKH UROVNEY R. NEVY),
W71-09130 02C

OW RESISTANCE
BEHAVIOR OF POROUS BED NEAR FLOW SINGULARITY,
W71-09108 02G

UID FLOW
EFFECT OF HYDROTURBINE OPERATING CONDITIONS ON THE INTENSITY OF CAVITATION EROSION,
W71-09070 08C

UIDICS
COMBINED SEWER REGULATION WITH FLUIDIC REGULATION,
W71-08948 05G

UIDIZED SANDS
THE ORIGIN AND SIGNIFICANCE OF SAND VOLCANOES IN THE BUDE FORMATION (CORNWALL),
W71-09321 02J

OD ABUNDANCE
A REVIEW OF POSSIBLE CAUSES OF MORTALITY OF OYSTER LARVAE OF THE GENUS CRASSOSTREA IN TOMALES BAY, CALIFORNIA,
W71-09041 05C

OD CHAINS
COLORADO TROUT LAKE STUDIES (NEW STUDIES ON EXPERIMENTAL CONTAMINATION OF MARINE SPECIES BY CS-137, RU-106, AND CE-144),
W71-09015 05C

EVALUATION OF INTERNAL IRRADITION DOSES FROM INGESTION BY HUMAN POPULATION OF FOOD CONTAMINATED BY SR-90 AND CS-137 FOR SETTING LEVELS FOR DISPOSAL IN THE ENVIRONMENT, (IN FRENCH),
W71-09192 05C

USSR REPORTS ON RADIOACTIVITY IN MAN AND THE ENVIRONMENT.
W71-09228 05C

EVALUATION OF RADIOACTIVE POLLUTION TRANSFER TO OCEAN AND SEA FOOD CHAINS (IN FRENCH),
W71-09229 05C

LEVEL OF RADIOACTIVE CONTAMINATION IN THE ENVIRONMENT AND IN THE FOOD CHAIN. ANNUAL REPORT, 1968 (IN FRENCH).
W71-09230 05C

STUDIES ON THE RADIOACTIVE CONTAMINATION OF THE SEA,
W71-09366 05C

OD WEBS
MATHEMATICAL METHODS FOR EVALUATING THE TRANSPORT AND ACCUMULATION OF RADIONUCLIDES,
W71-09008 05B

ODS
SYSTEMS OF ENGINEERING AND DEVELOPMENT OF COMMERCIALLY VALUABLE MARINE RESOURCES IN THE DELAWARE REGION,
W71-09259 02L

RAGE FISH
UTILIZATION OF HERBIVOROUS FISH IN FISH MANAGEMENT AND MELIORATION OF WATER BASINS, (IN RUSSIAN).
W71-09163 05G

RAMINIFERA
APPLICATION OF ASSOCIATION-ANALYSIS TO DISTRIBUTION STUDIES OF RECENT FORAMINIFERA,
W71-09177 05A

RECASTING
LONG-RANGE FORECASTING OF ICE BREAKUP ON RIVERS OF THE SEVERNYY KRAY (RUSSIAN VSKRITIYE REK SEVERNOGO KRAYA I METODIKA YEGO DOLGOSROCHNOGO PROGNOZA),
W71-09126 02C

A LONG-RANGE FORECAST OF WATER FLOW TO LARGE LAKES OF THE LADOGA BASIN (RUSSIAN DOLGOSROCHNYY PROGNOZ PRITOKA VODY V KRUPNYYE OZERA LADOZHSKOGO BASSEYNA),
W71-09129 04B

REIGN RESEARCH
THE TENTH INTERNATIONAL MICROBIOLOGICAL CONGRESS, (IN RUSSIAN),
W71-09161 02H

RESTS
PRECIPITATION, ITS CHEMICAL COMPOSITION AND EFFECT ON SOIL WATER IN A BEECH AND A SPRUCE FOREST IN SOUTH SWEDEN,
W71-09081 02K

NUMBER AND SPACING OF RAINFALL-GAUGES IN A DECIDUOUS FOREST STAND,
W71-09138 02B

FOULING
THE ADHESIVE PROPERTIES OF 'CHLORELLA VULGARIS',
W71-09261 05C

FOUNDATIONS
SAFETY FACTORS IN SOIL MECHANICS,
W71-09061 08D

FRANCE
PRELIMINARY INVESTIGATION OF THE SURFICIAL SEDIMENTS IN THE CAP-BRETON CANYON (SOUTHWEST FRANCE) AND THE SURROUNDING CONTINENTAL SHELF,
W71-09100 02J

FRESH WATER
A SELECTED BIBLIOGRAPHY OF TERRESTRIAL, FRESHWATER AND MARINE RADIATION ECOLOGY,
W71-09232 05C

FRESHWATER FISH
COLORADO TROUT LAKE STUDIES (NEW STUDIES ON EXPERIMENTAL CONTAMINATION OF MARINE SPECIES BY CS-137, RU-106, AND CE-144),
W71-09015 05C

FRESNO RIVER(CALIF)
DETERMINATION OF CHANNEL CAPACITY OF THE FRESNO RIVER DOWNSTREAM FROM HIDDEN DAMSITE, MADERA COUNTY, CALIFORNIA,
W71-09092 08B

FROGS
THE EFFECT OF PP'-DDT ON TADPOLES OF THE COMMON FROG (RANA TEMPORARIA),
W71-09385 05C

FUNCTIONAL GRADIENT TECHNIQUE
OPTIMIZATION OF DYNAMIC OPERATIONS RESEARCH MODELS BY A FUNCTIONAL GRADIENT TECHNIQUE,
W71-09216 06A

FUNGICIDES
EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

GAMBUSIA AFFINIS
THE EFFECT OF SIZE ON THE UPTAKE OF DDT FROM WATER BY FISH,
W71-09389 05C

EFFECTS OF SALINITY ON UPTAKE OF DDT, DDE AND DDD BY FISH.
W71-09390 05C

GASES
CARBON MONOXIDE IN RAINWATER,
W71-09105 02B

SOIL A NATURAL SINK FOR CARBON MONOXIDE,
W71-09297 02G

GASOLINE
ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
W71-09374 05C

GASTROPODS
DARIEN GASTROPOD POLYCLAVE (BIOENVIRONMENTAL AND RADIOLOGICAL-SAFETY FEASIBILITY STUDIES. ATLANTIC-PACIFIC CANAL),
W71-09251 05C

GAS-LIQUID CHROMATOGRAPHY
THE EFFECT OF SIZE ON THE UPTAKE OF DDT FROM WATER BY FISH,
W71-09389 05C

GEOCHEMICAL CYCLE
CARBON MONOXIDE IN RAINWATER,
W71-09105 02B

GEOCHEMISTRY
VARITATIONS IN DELTA S-34 IN SULFATES OF RECENT AND OLD SEA BASINS OF THE USSR (RUSSIAN VARIATSII DEL'TY S-34 V SUL'FATAKH SOVREMENNYKH I DREVNIKH MORSKIKH VODOYEMOV SOVETSKOGO SOYUZA),
W71-09098 02K

GEOCHEMICAL DISTRIBUTION PATTERNS AND MIGRATION FORMS OF GOLD IN NATURAL WATERS (RUSSIAN GEOKHIMICHESKIYE ZAKONOMERNOSTI RASPROSTRANENIYA I FORMY MIGRATSII ZOLOTA V PRIRODNYKH VODAKH),
W71-09119 02K

HYDROGEOCHEMISTRY OF SEDIMENTARY (INTERSTITIAL) BRINES OF SALT DEPOSITS (RUSSIAN K GIDROGEOKHIMII SEDIMENTATSIONNYKH RASSOLOV SOLYANYKH MESTOROZHDENIY),
W71-09121 02K

A MODEL STUDY OF THE SQUEEZING OUT OF INTERSTITIAL WATERS, (RUSSIAN K VOPROSU OB IZUCHENII NA MODELYAKH PROTSESSA OTZHATIYA SEDIMENTATSIONNYKH VOD),
W71-09277 02G

GEOLOGIC INVESTIGATIONS
AN ANCIENT HYDROGRAPHIC NETWORK ON THE KAMA, PECHORA AND VYCHEGDA INTERFLUVE (RUSSIAN DREVNYAYA GIDROGRAFICHESKAYA SET' NA MEZHDURECH'YE KAMY, PECHORY I VYCHEGDY),
W71-09102 02E

GOUNDWATERS OF THE MANGYSHLAK-UST URT OIL-AND GAS-BEARING REGION (RUSSIAN PODZEMNYYE VODY MANGYSHLAK-USTYURTSKOY NEFTEGAZONOSNOY PROVINTSII),
W71-09135 04B

GEOLOGIC TIME
ISOLATION AND IDENTIFICATION OF STEROLS FROM A PLEISTOCENE SEDIMENT,
W71-09095 02H

VARITATIONS IN DELTA S-34 IN SULFATES OF RECENT AND OLD SEA BASINS OF THE USSR (RUSSIAN VARIATSII DEL'TY S-34 V SUL'FATAKH SOVREMENNYKH I DREVNIKH MORSKIKH VODOYEMOV SOVETSKOGO SOYUZA),
W71-09098 02K

GEOMORPHOLOGY
DIFFERENTIAL EROSION OF CARBONATE-ROCK TERRANES,
W71-09307 02J

THE OFFSET COURSE OF THE ST. JOHNS RIVER, FLORIDA,
W71-09309 02J

GEOPHYSICS
TRITIUM GEOPHYSICS AS AN INTERNATIONAL RESEARCH PROJECT,
W71-09034 05B

GEORGIA
HYPNODINIUM-LIKE ALGAL BLOOMS IN GEORGIA LAKES,
W71-09173 05C

CERTIFICATION OF WATER AND WASTE WATER TREATMENT PLANT OPERATIONS ACT.
W71-09207 06E

CITY OF BARNESVILLE V PARHAM (CITY'S LIABILITY FOR DISCHARGING SEWAGE INTO OPEN STREAM).
W71-09244 06E

GEORGIAN SSR
INFLUENCE OF VOLCANIC ROCKS ON THE COMPOSITION OF HYDROTHERMAL SOLUTIONS (RUSSIAN VLIYANIYE VULKANOGENNYKH POROD NA SOSTAV GIDROTERMAL'NYKH RASTVOROV),
W71-09120 02K

GEOTHERMAL AREAS
HEAT TRANSFER MEASUREMENT IN A GEOTHERMAL AREA,
W71-09117 02F

HEAT FLOW FROM NATURAL GEYSERS,
W71-09118 02F

GEYSERS
HEAT TRANSFER MEASUREMENT IN A GEOTHERMAL AREA,

SPILLWAY AND NAVIGATION CONDITIONS, HOLT LOCK AND DAM, WARRIOR RIVER, ALABAMA. HYDRAULIC MODEL INVESTIGATION,
W71-09349 08B

NAVIGATION CONDITIONS AT LOCK AND DAM NO 4, ARKANSAS RIVER. HYDRAULIC MODEL INVESTIGATION,
W71-09350 08B

FILLING AND EMPTYING SYSTEMS, MILLERS FERRY AND JONES BLUFF LOCKS, ALABAMA RIVER, ALABAMA. HYDRAULIC MODEL INVESTIGATION,
W71-09351 08B

CULVERT PRESSURES, GREENUP LOCK, OHIO RIVER, KENTUCKY. HYDRAULIC PROTOTYPE TESTS,
W71-09353 08B

DROP STRUCTURES FOR WALNUT CREEK PROJECT, WALNUT CREEK, CALIFORNIA. HYDRAULIC MODEL INVESTIGATION,
W71-09354 08B

REDUCTION OF SHOALING IN CHARLESTON HARBOR AND NAVIGATION IMPROVEMENT OF COOPER RIVER, SOUTH CAROLINA HYDRAULIC MODEL INVESTIGATION,
W71-09355 08B

SPILLWAY AND OUTLET WORKS, SHELBYVILLE DAM, KASKASKIA RIVER, ILLINOIS. HYDRAULIC MODEL INVESTIGATION,
W71-09357 08B

NAVIGATION CONDITIONS AT LOCKS AND DAM NO. 4 MONONGAHELA RIVER, PENNSYLVANIA,
W71-09359 08A

NAVIGATION CONDITIONS AT BELLEVILLE LOCKS AND DAM, OHIO RIVER,
W71-09360 08B

STEADY-FLOW STABILITY TESTS OF NAVIGATION OPENING STRUCTURES, HILO HARBOR, TSUNAMI BARRIER, HILO, HAWAII, HYDRAULIC MODEL INVESTIGATION,
W71-09361 08B

HYDRAULIC TURBINES
TURBINE-DISCHARGE MEASUREMENTS BY CABLE-SUSPENDED CURRENT METERS,
W71-09052 08C

RADIOISOTOPES AND TURBINE FLOW MEASUREMENTS,
W71-09066 07B

EFFECT OF HYDROTURBINE OPERATING CONDITIONS ON THE INTENSITY OF CAVITATION EROSION,
W71-09070 08C

HYDRODYNAMICS
FLUID FORCE ANALYSIS AND ACCELERATING SPHERE TESTS,
W71-09109 08B

A MODEL STUDY OF THE SQUEEZING OUT OF INTERSTITIAL WATERS, (RUSSIAN K VOPROSU OB IZUCHENII NA MODELYAKH PROTSESSA OTZHATIYA SEDIMENTATSIONNYKH VOD),
W71-09277 02G

HYDROGEN CYANIDE
ANALYSIS OF WATER FOR MOLECULAR HYDROGEN CYANIDE,
W71-08952 05A

HYDROGEOLOGY
RECORDS OF PRECIPITATION, WATER LEVELS AND GROUNDWATER RECHARGE TO THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1970,
W71-09111 02F

WATER LEVELS IN CARBONATE ROCK TERRANES,
W71-09299 02F

HYDRAULIC TESTING OF WELL HTH-23 IN CENTRAL NEVADA,
W71-09324 02F

HYDRAULIC TESTING OF WELL HTH-4 IN CENTRAL NEVADA,
W71-09325 02F

HYDRAULIC TESTING OF WELL HTH-3 IN CENTRAL NEVADA,
W71-09326 02F

HYDRAULIC TESTING OF WELL HTH-5 IN CENTRAL NEVADA,
W71-09327 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-1, IN CENTRAL NEVADA,
W71-09328 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-2, IN CENTRAL NEVADA,
W71-09329 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-3, IN CENTRAL NEVADA,
W71-09330 02F

HYDRAULIC TESTING OF WELL HTH-21-1 IN CENTRAL NEVADA,
W71-09331 02F

HYDROLOGIC CYCLE
THE PERCH LAKE EVAPORATION STUDY - THE USE OF RADIOISOTOPES IN HYDROLOGY, FEBRUARY 1970, VIENNA, AUSTRIA.
W71-09032 05B

STUDY OF THE RELATIONSHIP BETWEEN ANNUAL RUNOFF OF RIVERS OF THE USSR AND ATMOSPHERIC CIRCULATION (RUSSIAN ISSLEDOVANIYE ZAVISIMOSTI GODOVOGO STOKA REK SSSR OT ATMOSFERNOY TSIRKULYATSII),
W71-09136 02A

ESTIMATING EVAPOTRANSPIRATION AN EVALUATION OF TECHNIQUES,
W71-09312 02D

HYDROLOGIC DATA
ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR NORTH CREEK, TRINITY RIVER BASIN, TEXAS - 1969,
W71-09080 07C

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA AND MUKEWATER CREEK, COLORADO RIVER BASIN, TEXAS, 1969,
W71-09083 07C

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR CALAVERAS CREEK, SAN ANTONIO RIVER BASIN, TEXAS, 1969,
W71-09084 07C

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1969,
W71-09086 07C

GEOLOGY AND GROUNDWATER RESOURCES OF TRAILL COUNTY PART 3 GROUNDWATER RESOURCES,
W71-09090 02F

GROUNDWATER DATA AS OF 1967--COLORADO DESERT SUBREGION, CALIFORNIA,
W71-09142 07C

SUMMARY OF THE GROUNDWATER DATA AS OF 1967--CALIFORNIA REGION,
W71-09143 02F

GROUNDWATER DATA AS OF 1967--NORTH COASTAL SUBREGION, CALIFORNIA,
W71-09144 07C

GROUNDWATER DATA AS OF 1967--SOUTH LAHONTAN SUBREGION, CALIFORNIA,
W71-09145 07C

GROUNDWATER DATA AS OF 1967--NORTH LAHONTAN SUBREGION, CALIFORNIA,
W71-09146 07C

GROUNDWATER DATA AS OF 1967--SAN JOAQUIN BASIN SUBREGION, CALIFORNIA,
W71-09147 07C

GROUNDWATER DATA AS OF 1967--SACRAMENTO BASIN SUBREGION, CALIFORNIA,
W71-09148 07C

HYDROLOGY OF COASTAL WATERS,
W71-09365 02L

HYDROLOGIC PROPERTIES
BIBLIOGRAPHIC DISCUSSION ON THE PHYSICO-CHEMICAL BEHAVIOR AND THE RADIOECOLOGY IN HYDROBIOLOGICAL SYSTEMS OF CERIUM AND OTHER LANTHANIDES, (IN FRENCH),
W71-09023 05C

HYDROMETRY
EFFECT OF CLAY ON THE ACCURACY OF THE HYDROMETER METHOD,
W71-09284 07B

MINERAL STUDIES IN THE GRAVITATION-GRADIENT FIELD 1. TH METHOD,
W71-09322 02J

HYPERPLASIA
HYPERPLASIA IN AN ESTUARINE BRYOZOAN ATTRIBUTABLE TO COAL TAR DERIVATIVES,
W71-09036 05C

HYPOXIA
EFFECTS OF HYPOXIA UPON RESPIRATION AND CIRCULATION IN THE DOGFISH SCYLIORHINUS STELLARIS,
W71-09375 05C

ICE BREAKUP
FIELD TESTS OF ICE PREVENTION TECHNIQUES,
W71-08976 04A

LONG-RANGE FORECASTING OF ICE BREAKUP ON RIVERS OF THE SEVERNYY KRAY (RUSSIAN VSKRITIYE REK SEVERNOGO KRAYA I METODIKA YEGO DOLGOSROCHNOGO PROGNOZA),
W71-09126 02C

ICE JAMS
FIELD TESTS OF ICE PREVENTION TECHNIQUES,
W71-08976 04A

CALCULATING MAXIMUM ICE JAM LEVELS OF THE NEVA RIVER (RUSSIAN RASCHET MAKSIMAL'NYKH ZAZHORNYKH UROVNEY R. NEVY
W71-09130 02C

IGNEOUS ROCKS
HYDRAULIC TESTING AND SAMPLING OF HOLE UE-3, IN CENTRAL NEVADA,
W71-09330 02F

IGNEOUS ROCKS
INFLUENCE OF VOLCANIC ROCKS ON THE COMPOSITION OF HYDROTHERMAL SOLUTIONS (RUSSIAN VLIYANIYE VULKANOGENNYKH POROD NA SOSTAV GIDROTERMAL'NYKH RASTVOROV),
W71-09120 02K

HYDRAULIC TESTING OF WELL HTH-23 IN CENTRAL NEVADA,
W71-09324 02F

HYDRAULIC TESTING OF WELL HTH-4 IN CENTRAL NEVADA,
W71-09325 02F

HYDRAULIC TESTING OF WELL HTH-3 IN CENTRAL NEVADA,
W71-09326 02F

HYDRAULIC TESTING OF WELL HTH-5 IN CENTRAL NEVADA,
W71-09327 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-1, IN CENTRAL NEVADA,
W71-09328 02F

HYDRAULIC TESTING AND SAMPLING OF HOLE UE-2, IN CENTRAL NEVADA,
W71-09329 02F

HYDRAULIC TESTING OF WELL HTH-21-1 IN CENTRAL NEVADA,
W71-09331 02F

ILLINOIS
KELLUM V VILLAGE OF GREENUP (UNRECORDED EASEMENT TO DISCHARGE SEWAGE).
W71-09155 06E

MILLER V MOBILE AND OHIO RR (INADEQUATE DRAIN BENEATH RAILROAD EMBANKMENT).
W71-09162 06E

JOYCE-WATKINS CO V INDUSTRIAL COMM'N (LOW-WATER MARK AS BOUNDARY BETWEEN COTERMINUS STATES).
W71-09176 06E

SANITARY DIST OF CHICAGO V CHICAG PACKING CO (DISCHARGE OF STOCKYARD WASTE INTO SEWAGE CHANNEL).
W71-09245 06E

REGIONAL WASTE WATER, SOLID WASTE DISPOSAL, WATER SUPPLY, AND STORM DRAINAGE SYSTEMS APPRAISAL.
W71-09356 05D

BUCKLES V CITY OF DECATUR (LIABILITY OF CITY FOR POLLUTION OF RIVER).
W71-09386 06E

CHRISTIE V SANITARY DISTRICT OF CHICAGO (LIABILITY FOR EXCESSIVE DISCHARGE OF WATER).
W71-09395 06E

TURNER V PIERSON-HOLLOWELL WALNUT CO (OWNERSHIP OF LAND TO THREAD OF STREAM).
W71-09399 06E

AN ACT IN RELATION TO WATER SUPPLY, DRAINAGE, SEWAGE, POLLUTION, AND FLOOD CONTROL IN CERTAIN COUNTIES.
W71-09433 06E

RIVERS, LAKES, AND STREAMS--REGU LATION.
W71-09443 06E

TAXATION-POLLUTION CONTROL FACILITIES.
W71-09444 06E

AN ACT IN REALTION TO PREVENTION AND ABATEMENT OF AIR, LAND AND WATER POLLUTION.
W71-09445 06E

AN ACT TO CREATE SANITARY DISTRICTS IN CERTAIN LOCALITIES.
W71-09446 06E

IMPACT
EXPERIMENTS IN ROCK CUTTING BY IMPACT METHODS,
W71-09058 08H

IMPAIRED WATER QUALITY
ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
W71-09374 05C

IMPOUNDMENTS
MANAGEMENT OF WATER QUALITY IN RELEASES FROM SOUTHWESTERN IMPOUNDMENTS,
W71-09401 05G

INCOME
STATE CORPORATE INCOME TAX DEDUCTIONS FOR AMOUNTS INVESTED IN ANTI-POLLUTION DEVICES, SYSTEMS AND FACILITIES.
W71-09202 06E

INDIA
SKEWNESS AS AN ENVIRONMENTAL INDICATOR IN THE SOLANI RIVER SYSTEM, ROORKEE (INDIA),
W71-09123 02J

INDIANA
OXYGEN PRODUCTION IN SOME NORTHERN INDIANA LAKES,
W71-09153 05C

CITY OF FRANKFORT V SLIPHER (MUNICIPAL SEWAGE DISPOSAL).
W71-09218 06E

INDUSTRIAL WASTES
ROTATING BIOLOGICAL CONTACTORS FOLLOWING ANEROBIC LAGOONS,
W71-08943 05D

AWAEROBIC STABILIZATION OF POTATO PROCESSING WASTES AS AFFECTED BY ORGANIC LOADING RATE,
W71-08959 05D

SOME PROBLEMS OF INDUSTRIAL WASTE DISPOSAL FROM A FERTILIZER PLANT,
W71-08961 05D

UTILIZATION AND STABILIZATION OF SOLID WASTES,
W71-08962 05D

TREATMENT OF BRASS MILL EFFLUENTS AT ANACONDA TORONTO PLANT,
W71-08963 05D

THE TREATMENT OF LIQUID WASTES FROM AN AUTOMOBILE MANUFACTURING OPERATION,
W71-08964 05D

REMOVAL OF PHENOL AND THIOCYANATE FROM COKE PLANT EFFLUENTS AT DOFASCO,
W71-08965 05D

OXIDATIVE ASSIMILATION OF NITROGEN-DEFICIENT INDUSTRIAL WASTE,
W71-08966 05D

TREATABILITY STUDIES FOR INDUSTRIAL WASTES,
W71-08967 05D

PRE-TREATMENT OF WASTES AT BARRIE TANNING LIMITED, BARRIE, ONTARIO,
W71-08969 05D

TREATMENT OF POTATO PROCESSING WASTES AT SALADA FOODS LTD., ALLISTON,
W71-08970 05D

HYDROLOGIC AND QUALITY CHARACTERISTICS OF THE LOWER MISSISSIPPI RIVER,
W71-09103 02E

REGIONALLY CONSOLIDATED INDUSTRIAL WASTE WATER TREATMENT.
W71-09210 06E

NEW PROCESS DETOXIFIES CYANIDE WASTES,
W71-09295 05D

WASTE DISPOSAL IN DEEP WELLS.
W71-09440 05E

INDUSTRIAL WATER
PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
W71-09091 07C

INDUSTRIAL WATER SUPPLY
PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
W71-09091 07C

INDUSTRIES
INDUSTRIAL POLLUTION CONTROL,
W71-08986 06E

ANIMAL SLAUGHTERING AND PROCESSING.
W71-09209 06E

INFILTRATION
DEPLETION OF STREAMFLOW BY INFILTRATION IN THE MAIN CHANNELS OF THE TUCSON BASIN, SOUTHEASTERN ARIZONA,
W71-09139 02E

INFLOW
CALCULATING RAINFALL RUNOFF LOSSES BY PRECIPITATION AND RUNOFF OF SMALL RIVERS USING THE DNIEPER RIVER-RECHITSA BASIN AS AN EXAMPLE (RUSSIAN VYCHISLENIYE POTER' DOZHDEVOGO STOKA PO OSADKAM I STOKU MALYKH REK NA PRIMERE BASSEYNA R. DNEPRA DO G. RECHITSY),
W71-09128 02E

INHIBITORS
MICRO-RESPIROMETRY AND EMULSIFIER TOXICITY,
W71-09045 05C

CHRONIC ENDRIN POISONING IN GOLDFISH, CARASSIUS AURATUS,
W71-09368 05C

INJECTION EVAPORATION
TRITIUM INJECTION AND CONCENTRATION DISTRIBUTION IN THE ATMOSPHERE,
W71-09033 05B

INJECTION WELLS
WASTE DISPOSAL IN DEEP WELLS.
W71-09440 05E

INLAND WATERWAYS
IDENTIFICATION AND INTERRELATIONSHIPS OF SECONDARY BENEFITS IN WATERWAYS DEVELOPMENT,
W71-09269 06B

REDUCTION OF SHOALING IN CHARLESTON HARBOR AND NAVIGATION IMPROVEMENT OF COOPER RIVER, SOUTH CAROLINA HYDRAULIC MODEL INVESTIGATION,
W71-09355 08B

INLETS(WATERWAYS)
SIMULATION OF TIDAL MOTION IN COMPLEX RIVER SYSTEMS AND INLETS BY A METHOD OF OVERLAPPING SEGMENTS,
W71-09093 02L

INORGANIC COMPOUNDS
ORIGIN OF PACIFIC OCEAN IRON-MANGANESE NODULES FROM RADIOISOTOPE DATA, (RUSSIAN PROISKHOZHDENIYE ZHELEZO-MARGANTSEVYKH KONKRETSIY TIKHOGO OKEANA PO DANNYM O RADIOIZOTOPAKH),
W71-09306 05A

INPUT-OUTPUT ANALYSIS
ECONOMIC-ECOLOGIC ANALYSIS IN THE CHARLESTOWN METROPOLITAN REGION AN INPUT OUTPUT STUDY,
W71-09002 06A

INSECT BEHAVIOR
EFFECT OF WATER TEMPERATURE ON NYMPHAL FEEDING RATE, EMERGENCE, AND ADULT LONGEVITY OF THE STONEFLY PTERONARCYS DORSATA,
W71-08977 05C

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-08978 05C

INSECT EMERGENCE
EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-09370 05C

INSECTICIDES
EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

CARBAMATE BIOASSAY USING DAPHNIA MAGNA,
W71-09373 05A

INSTITUTIONAL CONSTRAINTS
AN ANALYSIS OF ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR IMPLEMENTING AN INTEGRATED WATER SUPPLY AND WASTE MANAGEMENT PROGRAM IN THE WASHINGTON METROPOLITAN AREA,
W71-09260 06E

COMPREHENSIVE WATER RESOURCES MANAGEMENT - THE PAST AND THE FUTURE,
W71-09398 06E

THE COSSATOT RIVER --- ANOTHER LEGAL MILESTONE,

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR NORTH CREEK, TRINITY RIVER BASIN, TEXAS - 1969,
W71-09080 07C

NORTH DAKOTA
GEOLOGY AND GROUNDWATER RESOURCES OF TRAILL COUNTY PART 3 GROUNDWATER RESOURCES,
W71-09090 02F

NORTHEAST U
NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY APPENDIX D - GEOLOGY AND GROUND WATER (FINAL DRAFT),
W71-09106 03B

NORWAY
A COARSE-GRAINED POCKET BEACH COMPLEX, TANAFJORD (NORWAY),
W71-09282 02J

NUCLEAR EXPLOSIONS
RADIOACTIVE DEBRIS FROM UNDERGROUND NUCLEAR EXPLOSIONS. 1. PHYSICAL AND CHEMICAL CHARACTERISTICS. 2. BIOLOGICAL AVAILABILITY OF THE RADIONUCLIDES TO AQUATIC ANIMALS,
W71-09004 05C

BIOENVIRONMENTAL AND RADIOLOGICAL-SAFETY FEASIBILITY STUDIES, ATLANTIC-PACIFIC INTEROCEANIC CANAL, BIBLIOGRAPHY,
W71-09006 05C

MATHEMATICAL METHODS FOR EVALUATING THE TRANSPORT AND ACCUMULATION OF RADIONUCLIDES,
W71-09008 05B

DARIEN FISH POLYCLAVE,
W71-09009 05C

DARIAN PHYTOSOCIOLOGICAL DICTIONARY,
W71-09010 02I

DOSE ESTIMATION STUDIES RELATED TO PROPOSED CONSTRUCTION OF AN ATLANTIC-PACIFIC INTEROCEANIC CANAL WITH NUCLEAR EXPLOSIVES PHASE III,
W71-09238 05B

NUCLEAR POWER PLANTS
PILGRIM NUCLEAR POWER STATION. PRELIMINARY SAFETY ANALYSIS REPORT, AMENDMENT 16.
W71-09018 05B

RADIOLOGICAL SURVEILLANCE STUDIES AT A BOILING-WATER NUCLEAR

POWER REACTOR,
W71-09235 05B

ENVIRONMENTAL ASPECTS OF KARACHI NUCLEAR POWER PLANT,
W71-09236 05B

NUCLEAR WASTES
UPTAKE OF NITROSYL RUTHENIUM-106 ON CHITIN AND CHITOSAN FROM WASTE SOLUTIONS AND POLLUTED SEA WATER,
W71-09246 05C

RADIATION SURVEILLANCE - MONITORING THE ENVIRONS OF A NUCLEAR STATION,
W71-09249 05A

NUISANCE ALGAE
THE ADHESIVE PROPERTIES OF 'CHLORELLA VULGARIS',
W71-09261 05C

NUMERICAL ANALYSIS
AN INTRODUCTION TO THE NUMERICAL SOLUTION OF DIFFERENTIAL EQUATIONS IN ECOSYSTEM MODELS,
W71-09026 05C

NUTRIENT REQUIREMENTS
SOIL USE AND WATER QUALITY - A LOOK INTO THE FUTURE,
W71-09419 05C

NUTRIENTS
NUTRIENTS AND NUTRIENT BUDGET IN THE BAY OF QUINTE, LAKE ONTARIO,
W71-08953 05C

PRODUCTION, MINERAL NUTRIENT ABSORPTION, AND BIOCHEMICAL ASSIMILATION BY JUSTICIA AMERICANA AND ALTERNANTHERA PHILOXEROIDES,
W71-09178 05C

OBSTRUCTION TO FLOW
MILLER V MOBILE AND OHIO RR (INADEQUATE DRAIN BENEATH RAILROAD EMBANKMENT).
W71-09162 06E

OCEAN BOTTOM
THE SEAFLOOR EXCAVATOR, VOLUME IV. APPENDICES,
W71-09358 08D

OCEAN SURVEILLANCE
THE DEVELOPMENT OF A WIDE RANGE IMAGE SPECTRO PHOTOMETER INFORMATION SYSTEM,
W71-09258 07B

OCEAN WAVES
COASTAL REGIME - RECENT U. S. EXPERIENCE,
W71-09141 08B

INVESTIGATION OF IN-SHORE HARBOR, SITE X. REPORT 1. DESIGN FOR OPTIMUM WAVE CONDITIONS. HYDRAULIC MODEL INVESTIGATION,
W71-09345 08B

INVESTIGATION OF IN-SHORE HARBOR, SITE X. REPORT 2. DESIGNS OF RIPRAP COVER LAYERS. HYDRAULIC MODEL INVESTIGATION,
W71-09346 08B

OCEANOGRAPHY
INSTRUMENTATION RESEARCH FOR RADIATION MEASUREMENTS IN THE MARINE ENVIRONMENT,
W71-09242 05C

THE SEAS - BEGINNING OR END,
W71-09413 07B

OCEANS
EMERGENCY WATER POLLUTION PREVENTION ACT OF 1971 (A BILL TO ESTABLISH AN IMMEDIATE PROGRAM FOR THE PREVENTION OF OCEAN POLLUTION).
W71-08994 06E

TRITIUM GEOPHYSICS AS AN INTERNATIONAL RESEARCH PROJECT,
W71-09034 05B

THE SEAFLOOR EXCAVATOR, VOLUME IV. APPENDICES,
W71-09358 08D

STUDIES ON THE RADIOACTIVE CONTAMINATION OF THE SEA,
W71-09366 05C

A BILL TO REGULATE THE DISCHARGE OF WASTES IN TERRITORIAL AND INTERNATIONAL WATERS UNTIL FIVE YEARS AFTER THE ENACTMENT OF THE ACT AND TO PROHIBIT SUCH DISCHARGE THEREAFTER.
W71-09438 06E

OHIO
LOW-FLOW STUDY FOR SOUTHWEST OHIO STREAMS,
W71-09097 02E

FRANK TEA AND SPICE CO V L SCHREIBER AND SONS CO (PROPERTY DAMAGES FROM BLOCKAGE OF SEWER BUILT TO REPLACE NATURAL STREAM).
W71-09175 06E

NAGY V CITY OF AKRON (MUNICIPAL SURFACE WATER DRAINAGE).
W71-09187 06E

FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, HURON RIVER, NORWALK CREEK, OHIO.
W71-09337 04A

FLOOD PLAIN INFORMATION, VERMILION RIVER, SKELLENGER CREEK, AND BONNEY CREEK, OHIO.
W71-09340 04A

SHELTON V MOSIER (PRESCRIPTIVE RIGHT OF MILL DAM OWNER TO OVERFLOW UPPER STREAM).
W71-09369 06E

ANDREWS V VILLAGE OF GEORGETOWN (RESPONSIBILITY OF MUNICIPAL CORPORATION TO PREVENT FLOODS CAUSED BY STREET CONSTRUCTION).
W71-09396 06E

OIL FIELDS
POLLUTION PROBLEMS IN THE 'OIL PATCH',
W71-09303 05B

OIL INDUSTRY
AN ACT TO PROHIBIT THE SURFACE DISCHARGING SALTWATER ON THE SURFACE OF LANDS TO PROHIBIT TAX DEDUCTIONS TO THOSE WHO DISCHARGE SALTWATER AND FOR OTHER PURPOSES.
W71-09040 06E

POLLUTION PROBLEMS IN THE 'OIL PATCH',
W71-09303 05B

OIL POLLUTION
TOXICITY TESTS WITH OIL DISPERSANTS IN CONNECTION WITH OIL SPILL AT CHEDABUCTO BAY, NOVA SCOTIA,
W71-09039 05C

THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,
W71-09043 05C

THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
W71-09044 05C

MICRO-RESPIROMETRY AND EMULSIFIER TOXICITY,
W71-09045 05C

AERIAL PHOTOGRAPHY OF OIL SLICKS,
W71-09046 05A

ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
W71-09374 05C

OIL SPILL RECOVERY EQUIPMENT
TESTING AND EVALUATION OF OIL SPILL RECOVERY EQUIPMENT.
W71-08942 05G

OIL SPILLS
THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,
W71-09043 05C

THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
W71-09044 05C

AERIAL PHOTOGRAPHY OF OIL SLICKS,
W71-09046 05A

OIL WASTES
THE DEVELOPMENT OF A WIDE RANGE IMAGE SPECTRO PHOTOMETER INFORMATION SYSTEM,
W71-09258 07B

CONCEPT DEVELOPMENT OF A HEAVY DUTY OIL CONTAINMENT SYSTEM FOR USE ON THE HIGH SEAS.
W71-09367 05D

OILY WATER
HYPERPLASIA IN AN ESTUARINE BRYOZOAN ATTRIBUTABLE TO COAL TAR DERIVATIVES,
W71-09036 05C

TOXICITY TESTS WITH OIL DISPERSANTS IN CONNECTION WITH OIL SPILL AT CHEDABUCTO BAY, NOVA SCOTIA,
W71-09039 05C

THE EFFECTS OF OIL POLLUTION AND CLEANING ON SALT MARSH ECOLOGY,
W71-09043 05C

THE BIOLOGICAL EFFECTS OF MARINE OIL POLLUTION AND SHORE CLEANSING,
W71-09044 05C

AERIAL PHOTOGRAPHY OF OIL SLICKS,
W71-09046 05A

CONCEPT DEVELOPMENT OF A HEAVY DUTY OIL CONTAINMENT SYSTEM FOR USE ON THE HIGH SEAS.
W71-09367 05D

ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
W71-09374 05C

FINANCIAL RESPONSIBILITY FOR OIL POLLUTION CLEANUP.
W71-09432 06E

OLIGOCHAETES
DISTRIBUTION AND ABUNDANCE OF TUBIFICID (OLIGOCHAETA) SPECIES IN TORONTO HARBOUR, LAKE ONTARIO,

W71-09159 05C

BIOLOGICAL EVALUATION OF ENVIRONMENTAL QUALITY, GREEN BAY, LAKE MICHIGAN,
W71-09174 05C

-SITE TESTING
MEASUREMENTS OF THE ENGINEERING PROPERTIES OF MARINE SEDIMENTS,
W71-09291 02J

PERATION AND MAINTENANCE
CERTIFICATION OF WATER AND WASTE WATER TREATMENT PLANT OPERATIONS ACT.
W71-09207 06E

PERATIONS RESEARCH
OPTIMIZATION OF DISCRETE OPERATIONS RESEARCH MODELS BY DIFFERENTIAL SENSITIVITY ANALYSIS,
W71-09215 06A

REGON
FLOOD PLAIN INFORMATION, WILLAMETTE RIVER, JOHNSON, KELLOGG, AND MT. SCOTT CREEKS, MILWAUKIE-OAK GROVE-LAKE OSWEGO, OREGON.
W71-09336 04A

RGANIC COMPOUNDS
ORGANIC DESORPTION FROM CARBON-I A CRITICAL LOOK AT DESORPTION OF UNKNOWN ORGANIC MATERIALS FROM CARBON,
W71-08956 05D

INTERACTION OF TRACE ELEMENTS WITH THE ORGANIC CONSTITUENTS IN THE MARINE ENVIRONMENT,
W71-09188 05C

RGANIC LOADING
ANAEROBIC STABILIZATION OF POTATO PROCESSING WASTES AS AFFECTED BY ORGANIC LOADING RATE,
W71-08959 05D

PRE-TREATMENT OF WASTES AT BARRIE TANNING LIMITED, BARRIE, ONTARIO,
W71-08969 05D

RGANIC MATTER
RESULTS OF A STUDY OF ORGANIC MATTER IN GROUNDWATERS OF KAMCHATKA (RUSSIAN REZUL'TATY IZUCHENIYA ORGANICHESKIKH VESHCHESTV V PODZEMNYKH VODAKH KAMCHATKI),
W71-09099 02K

RGANOLEPTIC PROPERTIES
ABOUT THE MAXIMUM PERMISSIBLE POLLUTION OF SURFACE WATERS BY OIL AND OIL PRODUCTS OWING TO THEIR EFFECT ON THE WATER FAUNA AND ON THE ORGANOLEPTIC PROPERTIES OF WATER (IN CZECH),
W71-09374 05C

RGANOPHOSPHOROUS PESTICIDES
THE TOXICITY OF FOUR INSECTICIDES TO FOUR SALMONID SPECIES,
W71-09037 05C

EFFECT OF SESAMEX ON BRAIN ACETYLCHOLINESTERASE INHIBITION BY PARATHION IN FISHES,
W71-09378 05C

RGANO-PHOSPHOROUS PESTICIDES
INTERACTION OF PESTICIDES WITH AQUATIC MICROORGANISMS AND PLANKTON,
W71-09381 05C

RTHOGONALITY
BEHAVIOR OF POROUS BED NEAR FLOW SINGULARITY,
W71-09108 02G

UACHITA RIVER(LA)
RAINFALL-RUNOFF-HYDROGRAPH RELATIONS FOR NORTHERN LOUISIANA,
W71-09087 02A

VERFLOW
SHELTON V MOSIER (PRESCRIPTIVE RIGHT OF MILL DAM OWNER TO OVERFLOW UPPER STREAM).
W71-09369 06E

WNERSHIP OF BEDS
TURNER V PIERSON-HOLLOWELL WALNUT CO (OWNERSHIP OF LAND TO THREAD OF STREAM).
W71-09399 06E

STATE V SLOTNESS (TRUST DOCTRINE LIMITED TO WATER-CONNECTED PURPOSES).
W71-09449 06E

XIDATION
NEW PROCESS DETOXIFIES CYANIDE WASTES,
W71-09295 05D

XIDATION LAGOONS
ROTATING BIOLOGICAL CONTACTORS FOLLOWING ANEROBIC LAGOONS,
W71-08943 05D

WATER RECLAMATION AND ALGAE HARVESTING,
W71-08951 05D

XIDATIVE ASSIMILATION
OXIDATIVE ASSIMILATION OF NITROGEN-DEFICIENT INDUSTRIAL WASTE,
W71-08966 05D

XIDES
THE USE OF WATER AS A SAMPLING MEDIUM FOR TRITIUM OXIDE,
W71-09003 05B

OXYGEN
OXYGEN PRODUCTION IN SOME NORTHERN INDIANA LAKES,
W71-09153 05C

OXYGEN PRODUCTION
OXYGEN PRODUCTION IN SOME NORTHERN INDIANA LAKES,
W71-09153 05C

OXYGEN SAG
REPORT ON A FISH KILL AT LAGUNA JOYUDA, WESTERN PUERTO RICO, IN THE SUMMER, 1967,
W71-09376 05C

OXYGENATION
EFFECTS OF CONTAMINANTS ON REAERATION RATES IN RIVER WATER,
W71-08944 05G

OYSTERS
A REVIEW OF POSSIBLE CAUSES OF MORTALITY OF OYSTER LARVAE OF THE GENUS CRASSOSTREA IN TOMALES BAY, CALIFORNIA,
W71-09041 05C

EFFECTS OF PESTICIDES ON EMBRYONIC DEVELOPMENT OF CLAMS AND OYSTERS AND ON SURVIVAL AND GROWTH OF THE LARVAE,
W71-09047 05C

SYSTEMS OF ENGINEERING AND DEVELOPMENT OF COMMERCIALLY VALUABLE MARINE RESOURCES IN THE DELAWARE REGION,
W71-09259 02L

PACIFIC OCEAN
DOSE ESTIMATION STUDIES RELATED TO PROPOSED CONSTRUCTION OF AN ATLANTIC-PACIFIC INTEROCEANIC CANAL WITH NUCLEAR EXPLOSIVES PHASE III,
W71-09238 05B

TURBIDITIES OF THE NORTHEAST PACIFIC,
W71-09280 02J

ORIGIN OF PACIFIC OCEAN IRON-MANGANESE NODULES FROM RADIOISOTOPE DATA, (RUSSIAN PROISKHOZHDENIYE ZHELEZO-MARGANTSEVYKH KONKRETSIY TIKHOGO OKEANA PO DANNYM O RADIOIZOTOPAKH),
W71-09306 05A

PALEOHYDROLOGY
MICRITIC ENVELOPES OF CARBONATE GRAINS ARE NOT EXCLUSIVELY OF PHOTOSYNTHETIC ALGAL ORIGIN,
W71-09287 02J

PAMLICO RIVER
A COMPUTER BASED FLORISTIC ANALYSIS OF PAMLICO RIVER PHYTOPLANKTON,
W71-09211 05A

PARATHION
EFFECT OF SESAMEX ON BRAIN ACETYLCHOLINESTERASE INHIBITION BY PARATHION IN FISHES,
W71-09378 05C

PARTICLE SHAPE
SIGNIFICANCE OF PEBBLE SIZE AND SHAPE IN SORTING BY WAVES,
W71-09124 02J

A COARSE-GRAINED POCKET BEACH COMPLEX, TANAFJORD (NORWAY),
W71-09282 02J

PARTICLE SIZE
SKEWNESS AS AN ENVIRONMENTAL INDICATOR IN THE SOLANI RIVER SYSTEM, ROORKEE (INDIA),
W71-09123 02J

SIGNIFICANCE OF PEBBLE SIZE AND SHAPE IN SORTING BY WAVES,
W71-09124 02J

LONGITUDINAL DUNES OF THE NORTHWESTERN EDGE OF THE SIMPSON DESERT, NORTHERN TERRITORY, AUSTRALIA, 1. GEOMORPHOLOGY AND GRAIN SIZE RELATIONSHIPS,
W71-09279 02J

A COARSE-GRAINED POCKET BEACH COMPLEX, TANAFJORD (NORWAY),
W71-09282 02J

BREAK OF SLOPE IN PARTICLE-SIZE CURVES OF GLACIAL TILLS,
W71-09283 02J

EFFECT OF CLAY ON THE ACCURACY OF THE HYDROMETER METHOD,
W71-09284 07B

NUMERICAL ESTIMATES OF ANCIENT WAVES, WATER DEPTH AND FETCH,
W71-09288 02J

SELF-OPERATED PIPETTE FOR GRAIN-SIZE ANALYSIS A PROTOTYPE,
W71-09318 07B

PARTICLE SIZE ANALYSIS
BREAK OF SLOPE IN PARTICLE-SIZE CURVES OF GLACIAL TILLS,
W71-09283 02J

EFFECT OF CLAY ON THE ACCURACY OF THE HYDROMETER METHOD,
W71-09284 07B

SELF-OPERATED PIPETTE FOR GRAIN-SIZE ANALYSIS A PROTOTYPE,
W71-09318 07B

PASTURE MANAGEMENT
IRRIGATION METHODS FOR MEADOWS AND PASTURES (RUSSIAN TEKHNIKA POLIVA LUGOV I PASTBISHCH),
W71-09132 03F

PATH OF POLLUTANTS
DYNAMICS OF MS-222 IN THE BLOOD AND BRAIN OF FRESHWATER FISHES DURING ANETHESIA,
W71-09049 05C

DISPERSION IN HETEROGENEOUS NONUNIFORM ANISOTROPIC POROUS MEDIA,
W71-09079 05B

ENVIRONMENTAL ASPECTS OF KARACHI NUCLEAR POWER PLANT,
W71-09236 05B

WHERE DOES WATER QUALITY IMPROVEMENT BEGIN,
W71-09300 05B

FIELD STUDY OF SUBSURFACE SPENT SULFITE LIQUOR MOVEMENT USING EARTH RESISTIVITY MEASUREMENTS,
W71-09302 05B

THE EFFECT OF SIZE ON THE UPTAKE OF DDT FROM WATER BY FISH,
W71-09389 05C

EFFECTS OF SALINITY ON UPTAKE OF DDT, DDE AND DDD BY FISH.
W71-09390 05C

PATHOLOGY
HYPERPLASIA IN AN ESTUARINE BRYOZOAN ATTRIBUTABLE TO COAL TAR DERIVATIVES,
W71-09036 05C

EFFECT OF COBALT ON SEA URCHIN MORPHOGENESIS,
W71-09239 05C

PECOS RIVER BASIN
LINEAR PROGRAMING MODELS FOR ESTIMATING THE AGRICULTURAL DEMAND FUNCTION FOR IMPORTED WATER IN THE PECOS RIVER BASIN,
W71-09421 06A

PENAEUS DUORARUM
LOCALIZATION OF DDT IN THE BODY ORGANS OF PINK AND WHITE SHRIMP,
W71-09167 05C

PENAEUS SETIFERUS
LOCALIZATION OF DDT IN THE BODY ORGANS OF PINK AND WHITE SHRIMP,
W71-09167 05C

PENNSYLVANIA
WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN PENNSYLVANIA.
W71-09112 04A

PEORIA COUNTY(ILL)
REGIONAL WASTE WATER, SOLID WASTE DISPOSAL, WATER SUPPLY, AND STORM DRAINAGE SYSTEMS APPRAISAL.
W71-09356 05D

PERCOLATING WATERS
TENNESSEE ELECTRIC POWER CO V DODSON (OBSTRUCTION OF GROUNDWATER FLOW).
W71-09400 06E

PERIPHYTON
ON THE GROSS AND NET PRODUCTION OF PERIPHYTON AND PLANKTON ALGAE, (IN RUSSIAN),
W71-09165 05C

PERMAFROST
PERENNIAL ICE AND SNOW MASSES--A GUIDE FOR COMPILATION AND ASSEMBLAGE OF DATA FOR A WORLD INVENTORY.
W71-09311 02C

PERMEABILITY
SOIL-CEMENT SEEPAGE TEST SECTION LUBBOCK REGULATING RESERVOIR CANADIAN RIVER PROJECT, TEXAS,

WATER RIGHTS PROBLEMS IN THE UPPER RIO GRANDE WATERSHED AND ADJOINING AREAS,
W71-09426 06E

NUISANCE LAW AS AN ENVIRONMENTAL TOOL,
W71-09442 06F

UBLIC UTILITY DISTRICTS
AN ACT PROVIDING FOR THE INCORPORATION OF PUBLIC WATER, SEWER AND FIRE PROTECTION DISTRICTS.
W71-09206 06E

UBLIC WATER SUPPLY
PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
W71-09091 07C

ULVERIZATION
ECONOMICS OF COMPOSTING MUNICIPAL REFUSE IN EUROPE AND ISRAEL,
W71-09417 05E

PYRITE
PYRITE DEPRESSION BY REDUCTION OF SOLUTION OXIDATION POTENTIAL.
W71-09078 05D

QUARTZ
MINERAL STUDIES IN THE GRAVITATION-GRADIENT FIELD 2. CHANGES OF QUARTZ SAND DENSITY DUE TO NATURAL AND EXPERIMENTAL 'MATURATION'.
W71-09323 02J

QUASILINEARIZATION
WATER RESOURCES MODELING BY QUASILINEARIZATION AND INVARIANT IMBEDDING,
W71-09217 05G

ITERATIVE TECHNIQUES IN OPTIMIZATION,
W71-09222 06F

QUASILINEARIZATION TECHNIQUE
DYNAMIC PROGRAMMING, QUASILINEARIZATION AND THE DIMENSIONALITY DIFFICULTY,
W71-09221 06A

QUASILINEARIZATION *INVARIANT IMBEDDING
INVARIANT IMBEDDING, ITERATIVE LINEARIZATION, AND MULTISTAGE COUNTERCURRENT PROCESSES III. ESTIMATION AND THE OVER-DETERMINED SYSTEM,
W71-09219 06A

QUICKSAND
THE ORIGIN AND SIGNIFICANCE OF SAND VOLCANOES IN THE BUDE FORMATION (CORNWALL),
W71-09321 02J

RADIATION
RADIOLOGICAL SURVEILLANCE STUDIES AT A BOILING-WATER NUCLEAR POWER REACTOR,
W71-09235 05B

RADIOACTIVE DATING
ORIGIN OF PACIFIC OCEAN IRON-MANGANESE NODULES FROM RADIOISOTOPE DATA, (RUSSIAN PROISKHOZHDENIYE ZHELEZO-MARGANTSEVYKH KONKRETSIY TIKHOGO OKEANA PO DANNYM O RADIOIZOTOPAKH),
W71-09306 05A

RADIOACTIVE WASTE DISPOSAL
DISPOSAL OF RADIOACTIVE WASTE FROM U.S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
W71-09030 05B

BEHAVIOR OF NATURAL RADIOACTIVE ELEMENTS IN STANDING RESERVOIRS,
W71-09243 05D

RADIOACTIVE WASTES
BEHAVIOR OF NATURAL RADIOACTIVE ELEMENTS IN STANDING RESERVOIRS,
W71-09243 05D

RADIATION SURVEILLANCE - MONITORING THE ENVIRONS OF A NUCLEAR STATION,
W71-09249 05A

RADIOACTIVITY
NATURAL ENVIRONMENTAL RADIOACTIVITY. AN ANNOTATED BIBLIOGRAPHY,
W71-09234 05C

STUDIES ON THE RADIOACTIVE CONTAMINATION OF THE SEA,
W71-09366 05C

RADIOACTIVITY EFFECTS
RADIATION ECOLOGY STUDIES, PROGRESS REPORT, JAN. 1968-JAN. 1969,
W71-09185 05C

THE BRITISH APPROACH TO ENVIRONMENTAL MONITORING,
W71-09240 05B

CONFERENCE REPORT ON HR 4148, WATER QUALITY IMPROVEMENT ACT OF 1970.
W71-09431 06E

CLEAN WATER COMMITMENT ACT OF 1971 (A BILL TO PROVIDE A NATIONAL COMMITMENT FOR FINANCING OF EXPANDED PROGRAMS UNDER THE FEDERAL WATER POLLUTION CONTROL ACT, TO ASSURE BETTER COORDINATION IN DEVELOPMENT OF CLEAN WATER PROGRAMS).
W71-09437 06E

WATER QUALITY ACT
WATER QUALITY ACT OF 1965 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO ESTABLISH THE FEDERAL WATER POLLUTION CONTROL ADMINISTRATION.
W71-09200 06E

WATER QUALITY CONTROL
EFFECTS OF CONTAMINANTS ON REAERATION RATES IN RIVER WATER,
W71-08944 05G

TOWARDS BETTER ADMINISTRATION OF WATER QUALITY CONTROL,
W71-08979 05G

THE PORTER-COLOGNE WATER QUALITY CONTROL ACT.
W71-08991 05G

EMERGENCY WATER POLLUTION PREVENTION ACT OF 1971 (A BILL TO ESTABLISH AN IMMEDIATE PROGRAM FOR THE PREVENTION OF OCEAN POLLUTION).
W71-08994 06E

VALUATION OF FLOW AUGMENTATION RELEASES,
W71-09000 05G

UTILIZATION OF HERBIVOROUS FISH IN FISH MANAGEMENT AND AMELIORATION OF WATER BASINS, (IN RUSSIAN).
W71-09163 05G

PRIVATE REMEDIES FOR WATER POLLUTION.
W71-09195 06E

WATER RESOURCES MODELING BY QUASILINEARIZATION AND INVARIANT IMBEDDING,
W71-09217 05G

MANAGEMENT OF WATER QUALITY IN RELEASES FROM SOUTHWESTERN IMPOUNDMENTS,
W71-09401 05G

WATER, WATER EVERYWHERE,
W71-09412 05A

WATER QUALITY STANDARDS (PROCEDURE FOR REVISION).
W71-09434 06E

SALINE WATER CONVERSION ACT OF 1971 (A BILL TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONTINUE RESEARCH AND DEVELOPMENT FOR THE TREATMENT OF SALINE AND OTHER CHEMICALLY CONTAMINATED WASTE WATER TO MAINTAIN OR IMPROVE THE QUALITY OF WATER).
W71-09435 06E

NUTRIENT REMOVAL AND ADVANCED WASTE TREATMENT.
W71-09450 05D

WATER QUALITY IMPROVEMENT ACT OF 1970
LIABILITY FOR OIL POLLUTION CLEANUP AND THE WATER QUALITY IMPROVEMENT ACT OF 1970,
W71-08988 05G

WATER RATES
WATER BILLS AND COMPUTERS,
W71-09405 06C

WATER RESOURCE DEVELOPMENT
TURNABOUT ON THE CHATTOOGA,
W71-09411 06G

WATER RESOURCES
SIMULATION OF WATER RESOURCE REGIMES,
W71-08974 06A

MODELING REGIONAL ECONOMIC AND ENVIRONMENTAL INTERRELATIONSHIPS,
W71-09248 06D

LEGAL ASPECTS OF WATER USE AND CONTROL IN SOUTH CAROLINA. PART A -- LEGAL CONSIDERATIONS RELATING TO A NEW WATER RESOURCES LAW FOR SOUTH CAROLINA,
W71-09363 06E

COMPREHENSIVE PLANNING IN THE SOUTHEAST,
W71-09418 06B

WATER RESOURCES DEVELOPMENT
THE PORTER-COLOGNE WATER QUALITY CONTROL ACT.
W71-08991 05G

HEATED EFFLUENT - AN ASSET TO AGRICULTURE,
W71-09028 05C

GEOLOGY AND GROUNDWATER RESOURCES OF TRAILL COUNTY PART 3 GROUNDWATER RESOURCES,
W71-09090 02F

PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
W71-09091 07C

NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY APPENDIX D - GEOLOGY AND GROUND WATER (FINAL DRAFT),
W71-09106 03B

WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN PENNSYLVANIA.
W71-09112 04A

WATER RESOURCES DEVELOPMENT BY THE U. S. ARMY CORPS OF ENGINEERS IN THE DISTRICT OF COLUMBIA.
W71-09113 04A

LAND RECLAMATION AND COMPLEX USE OF WATER RESOURCES (RUSSIAN MELIORATSIYA ZEMEL' I KOMPLEKSNOYE ISPOL' ZOVANIYE VODNYKH RESURSOV),
W71-09134 04A

AN ACT FOR A COMPREHENSIVE WATER AND RELATED LAND RESOURCES MANAGEMENT PROGRAM (THE ARKANSAS WATER PLAN).
W71-09201 06E

IDENTIFICATION AND INTERRELATIONSHIPS OF SECONDARY BENEFITS IN WATERWAYS DEVELOPMENT,
W71-09269 06B

PRELIMINARY EVALUATION OF THE HYDROLOGIC EFFECTS OF IMPLEMENTING WATER AND SEWERAGE PLANS, DADE COUNTY, FLORIDA,
W71-09334 06D

BENEFITS AND BENEFICIARIES CONTRASTING ECONOMIC AND CULTURAL DISTINCTIONS,
W71-09392 06C

COMPREHENSIVE WATER RESOURCES MANAGEMENT - THE PAST AND THE FUTURE,
W71-09398 06E

STATE ORGANIZATIONS FOR WATER RESOURCES PLANNING,
W71-09425 06E

PATTERNS OF POLITICS IN WATER RESOURCES DEVELOPMENT,
W71-09427 06E

WATER REUSE
WATER RECLAMATION AND ALGAE HARVESTING,
W71-08951 05D

IDENTIFICATION OF IRRIGATION RETURN WATER IN THE SUB-SURFACE, PHASE III KAHUKO, OAHU AND KAHULUI AND LAHAINA, MAUI,
W71-08972 05B

AUTO-MECHANIZATION OF PIPE DISTRIBUTION SYSTEMS,
W71-09068 03F

OBSERVATIONS ON WATER CONTENT CHANGES IN STRATIFIED SEDIMENTS DURING PIT RECHARGE,
W71-09301 04B

HANDLING HOT WATER, WITH A PAYOFF,
W71-09423 05G

WATER SUPPLY
ESTIMATION AND USE OF WATER PRODUCTION FUNCTIONS IN CROPS,
W71-08997 03F

PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI,
W71-09091 07C

TOWN OF SMITHFIELD V CITY OF RALEIGH (CITY'S DISCHARGE OF RAW SEWAGE INTO ANOTHER CITY'S WATER SOURCE).
W71-09107 06E

AN ANALYSIS OF ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR IMPLEMENTING AN INTEGRATED WATER SUPPLY AND WASTE MANAGEMENT PROGRAM IN THE WASHINGTON METROPOLITAN AREA,
W71-09260 06E

PRELIMINARY EVALUATION OF THE HYDROLOGIC EFFECTS OF IMPLEMENTING WATER AND SEWERAGE PLANS, DADE COUNTY, FLORIDA,
W71-09334 06D

MORE WATER TREATMENT NEEDED,
W71-09424 05G

WATER RIGHTS PROBLEMS IN THE UPPER RIO GRANDE WATERSHED AND ADJOINING AREAS,
W71-09426 06E

WATER TABLE
A PRELIMINARY EVALUATION OF BANK STORAGE ASSOCIATED WITH LIBBY RESERVOIR IN NORTHWESTERN MONTANA,
W71-09137 03B

WATER TEMPERATURE
EFFECT OF WATER TEMPERATURE ON NYMPHAL FEEDING RATE, EMERGENCE, AND ADULT LONGEVITY OF THE STONEFLY PTERONARCYS DORSATA,
W71-08977 05C

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-08978 05C

THE CRITICAL THERMAL MAXIMUM OF JUVENILE SPOT, LEIOSTOMUS XANTHURUS, LACEPEDE,
W71-09212 05C

FOREST CUTTINGS RAISE TEMPERATURES OF SMALL STREAMS IN THE SOUTHERN APPALACHIANS,
W71-09274 04C

EFFECT OF TEMPERATURE AT DIFFERENT ALTITUDES ON THE EMERGENCE OF AQUATIC INSECTS FROM A SINGLE STREAM,
W71-09370 05C

REPORT ON A FISH KILL AT LAGUNA JOYUDA, WESTERN PUERTO RICO, IN THE SUMMER, 1967,
W71-09376 05C

THE EFFECTS OF WATER HARDNESS ON THE UPPER LETHAL TEMPERATURE OF THE GREEN SUNFISH (LEPOMIS CYANELLUS),
W71-09382 05C

LAKE ERIE COMMON EFFORT CAN SAVE IT.
W71-09387 05C

WATER TYPES
GOUNDWATERS OF THE MANGYSHLAK-UST URT OIL-AND GAS-BEARING REGION (RUSSIAN PODZEMNYYE VODY MANGYSHLAK-USTYURTSKOY NEFTEGAZONOSNOY PROVINTSII),
W71-09135 04B

WATER UTILIZATION EFFICIENCIES
RAINFALL USE EFFICIENCY FOR DRYLAND BARLEY WITH THREE CROP AND WATER MANAGEMENT SYSTEMS,
W71-08975 03F

WATER VAPOR
TRITIUM GEOPHYSICS AS AN INTERNATIONAL RESEARCH PROJECT,
W71-09034 05B

WATER WELLS
GROUNDWATER DATA AS OF 1967--COLORADO DESERT SUBREGION, CALIFORNIA,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association Research Foundation.

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
NOV 17 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 4, NUMBER 18
SEPTEMBER 15, 1971

W71-09465 -- W71-09931

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 18
SEPTEMBER 15, 1971

W71-09465 -- W71-09931

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CARBONATE SPECIES AND NOT POLYWATER FORMED ON MAGNESIUM OXIDE,
Cambridge Univ. (England). Colloid Science Labs.; and Cambridge Univ. (England). Dept. of Biochemistry.
D. L. Whateley.
Nature, Physical Science, Vol 231, No 25, p 178-179, June 21, 1971. 2 p, 2 ref.

Descriptors: *Water properties, *Aqueous solutions, *Carbonates, Magnesium, Spectroscopy, Water analysis, Water chemistry.
Identifiers: *Polywater.

The infrared spectrum of polywater formed on magnesium oxide can more readily be interpreted in terms of the presence of carbonate species. Magnesium oxide readily adsorbs carbon dioxide, and the infrared spectra of carbon dioxide and water adsorbed separately and together on MgO powder show a number of adsorption bands in the region 1,300-1,665/cm. The observation that magnesium hydroxide or MgO after soaking in liquid H2O gives no such spectrum supports the interpretation of the observed spectrum in terms of carbonate species. (Knapp-USGS)

HYDROLOGIC RECONNAISSANCE OF THE DELTA RIVER AND ITS DRAINAGE BASIN, ALASKA.
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. L. Dingman, H. R. Samide, D. L. Saboe, M. J. Lynch, and C. W. Slaughter.
Available from the National Technical Information Service as AD-722 217, $3.00 in paper copy, $0.95 in microfilm. CRREL Research report 262, Feb 1971. 83 p.

Descriptors: *Rivers, *Flow, *Drainage, Hydrologic date, *Glaciers, Melting, Sedimentation, Rainfall, Inland waterways, Remote sensing, Aerial photography.
Identifiers: Aerial reconnaissance, *Alaska, Hydraulic models, Delta River, Stream flow.

A one-year reconnaissance study was made of a large braided glacial river and its drainage basin (drainage area 1665 m2; elevation range 1000 - 10,000 ft) for which a minimum of hydrometric and meterologic data existed. The report includes estimates of the water balance, flow-duration curves, and sediment characteristics, and descriptions of stream response to glacial melt and rain, channel geometry and channel processes. Mean annual basin precipitation is estimated at 40.4 in. and mean annual loss of permanent glacial storage is about 1 in. About 30% of this leaves the basin as evapo-transpiration, 50% as stream flow, and 20% as groundwater flow. Characteristics of response to glacial melt are outlined. Flow peaks near the mouth occur with 24 hours of rainfall greater than 1.5 in./day at foothills meterological stations; rains of less than that amount do not generally produce discernible stream response. Stream channel geometry is described in detail. Most channels on the lower floodplain are assymmetrical and are roughly triangular or parabolic, and have high width/depth ratios. At-a-station hydraulic geometry is described. Surveys and ground and aerial photography are used to describe channel changes.

FORECASTING THE SPRING 1969 MIDWEST SNOWMELT FLOODS,
National Weather Service, Kansas City, Mo, Central Region.
Herman F. Mondschein.
Available from the National Technical Information Service as COM71-00489, $3.00 in paper copy, $0.95 in microfiche. NOAA Technical memorandum NWS-CR-40, Feb 1971. 5 p.

Descriptors: *Flood forecasting, *Snow melt, *Flood Control, *Mathematical models, Missouri, Sequential generation, Surface runoff, Snowfall.
Identifiers: Spring season, Sequential analysis.

The winter of 1968-69 in the upper midwest was one of the worst on record, resulting in a long period of very heavy snow of high water content over a very large area, with widespread, disastrous spring floods in its wake. The use of hydrologic data by the National Weather Service's River Forecast Center in Kansas City, Missouri, to estimate flood potential up to 2 1/2 months prior to the onset of flooding, and for day-by-day short-term flood forecasting is described. The principle ingredients involved in determining the magnitude and extent of snowmelt flooding are shown to be: (1) the depth of runoff which is a function of water equivalent of the snowpack at the onset of melt, precipitation during the melting period, and antecedent soil moisture. (2) the rate of melt which is shown to be related to daily air temperature and showpack water content. The application of digital computer technology to hydrologic models has been of inestimable value in the processing of hydrologic data for the specific purpose of river stage and flood forecasting. Examples of these computer applications to flood prediction in the 1969 upper midwest spring snowmelt floods are shown.

CONVERGENCE CRITERIA FOR ITERATIVE HYDROLOGIC ROUTING MODELS,
Water Resources Engineers, Inc., Springfield, Va.
G. K. Young.
Water Resources Research, Vol 7, No 3, p 536-542, Jun 1971. 7 p, 1 fig, 5 tab, 4 ref. Bur Public Roads Contract FH-11-7324.

Descriptors: *Routing, Numerical analysis, *Rainfall-runoff relationships, Open channel flow, Dynamic programming, Mathematical studies, Mathematical models, Water storage, Stage-discharge relations, Model studies.
Identifiers: *Routing models.

An iterative process used to solve flow dynamics is discussed using a highway culvert and embankment system as an example. Time step criteria govern convergence of the iterative process. The Lipschitz ratio is applied to calculate the controlling algebraic time step relationship. The time step for convergence varies with current inflow and antecedent storage. Parameters of the iterative process are calculated for the example by assuming nonlinear functional forms for stage storage and discharge storage relationships by inferring the appropriate coefficients. Numerical results are presented for several extreme cases that bracket orifice and weir flow conditions. The approach should be applicable to other hydrologic systems such as small dams, catch basin flow, and retarding basins. This analysis aids in a selection of a time increment for direct routing for the direct conversion of rainfall excess to watershed outflow. (Knapp-USGS)

AN OUTLINE OF THE DEVELOPMENT OF HYDROLOGY IN THE USSR (Russian: Ocherki razvitiya gidrologii v SSSR),
A. A. Sokolov, and A. I. Chebotarev.
Leningrad, Gidrometeoizdat, 1970. 310 p.

Descriptors: *Water resources, *Water resources development, *Water balance, *Hydrologic data, *Hydrologic aspects, Forecasting, Flow, Hydrographs, Runoff, Soils, Rivers, Hydrometry, Lakes, Reservoirs, Floods, Evaporation, Ice, Snow, Instrumentation, Heat balance.
Identifiers: *USSR, State Hydrological Institute, Hydrophysical studies, Hydrochemical studies, Hydrological stations.

A history of the study of water resources of the USSR is examined with particular reference to investigations conducted by a leading institute in Soviet hydrological research, the State Hydrological Institute. The role of the Institute in establishing a basic network of hydrological stations and in developing theoretical, experimental and field studies is discussed in the light of concrete achievements and trends observed in the utilization of water. Plans for the maximum development of USSR water resources involve water balance estimates to 1980, 2000, and even beyond, taking into account the rapidly growing exploitation of water resources and the influence of human activity on the transformation of river regimes. A bibliography of the more important Soviet publications on hydrology is appended to each of the 11 chapters. (Josefson-USGS)

MONSOONAL RESPONSE IN THE WESTERN INDIAN OCEAN,
Rosentiel School of Marine and Atmospheric Science, Miami, Fla.; and National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
Walter Duing, and Karl-Heinz Szekielda.
Journal of Geophysical Research, Vol 76, No 18, p 4181-4187, June 20, 1971. 7 p, 4 fig, 1 tab, 15 ref. ONR Contract N0014-67-A-0201-0013, Project NR 083-06017-16-70 (481).

Descriptors: *Ocean currents, *Indian Ocean, *Monsoons, *Synoptic analysis, Winds, Advection,

Currents (Water), Convection, Temperature, Heat balance, Seasonal, Climatology.
Identifiers: *Somali current.

Infrared observations from spacecraft were used to investigate the response of the Somali Current to the onset of the southwest monsoon. Selected satellite observations from three years were available for this study. The time-dependent development of horizontal temperature gradients at the sea surface serves as an indicator for the formation of the baroclinic structure of the Somali Current. A comparison is made with the simultaneous development of the southwest component of the monsoon wind. The investigation reveals that the temperature gradient during the early formation stage in all years are directly proportional to the wind speed. The phase lag between the development of wind and temperature gradient during the buildup of the boundary current has a mean value of twelve days. During the decay period in late summer and fall, the lag increases continuously up to forty days. The observations suggest that two phenomena of different spatial scales play an important role during the formation of the Somali Current; in the early stage (May, June), local wind-induced upwelling seems to be the more important source of baroclinicity; in the latter stage of the buildup (July), large-scale geostrophic effects seem to be dominating. THE METEOROLOGY OF KANSAS DROUGHTS,
Kansas Water Resources Board, Topeka.
Donald Kostecki.
Kansas Water News, Vol 13, Nos 4, 5, and 6, p 17-21, 1970. 5 p, 2 fig, 2 tab, 5 ref.

Descriptors: *Droughts, *Kansas, *Meteorology, *Synoptic analysis, Reviews, Climatology, Dust storms, Moisture deficit, Precipitation (Atmospheric), Water storage.

A brief review is presented of the causes and effects of droughts in Kansas. In Kansas, except for the dry-weather flow of some streams and the water pumped from confined aquifers, precipitation is the only source of water supply. Consequently, and particularly when concerned with an extended dry period, the amount of precipitation received compared to the normally expected amount during the period is a reasonable measure of the magnitude of moisture deficiency. Drought is caused by the persistence of a given pattern of large high and low pressure cells in the global circulation pattern of the atmosphere. Normally, a dynamic high pressure cell, called the Azores High, expands during the warm months of the year and contracts during the colder months. As it expands, it pumps moist air from the Gulf of Mexico into the Great Plains in the spring and the contact of the warmer moist air with colder continental air creates the spring and early summer rains common to Kansas. As it contracts in the fall, another increase in rainfall occurrences often takes places. However, if this high pressure cell expands earlier and remains longer, the effect is a lack of precipitation and drought conditions. Droughts of the 1930's and 1950's were not equally severe for all parts of Kansas. The 1950's drought was the worst of record for much of eastern Kansas, and the peak of the drought of 1956 was more severe than any peak period during the 1930's for most areas of the state. In contrast, the drought of the 1930's was by far the longest of record with more disastrous consequences state-wide. (Knapp-USGS)

WATER CONDITIONS IN CALIFORNIA.
California State Dept. of Water Resources, Sacramento.

Report No 1, February 1, 1971, 15 p, 24 fig, 3 tab. Bulletin No 120-71.

Descriptors: *Snow surveys, *California, *Snowpacks, *Water supply, *Runoff, Reservoir storage, Water resources, Precipitation (Atmospheric), Snow.
Identifiers: *Water conditions.

The first monthly comprehensive statewide snow surveys of the 1971 season revealed that California's snow zone is storing up to one and one-half times the normal amount of water. A nine day storm in November, followed by a second intense cold storm that continued into December, produced a near record early season snowpack. This heavy snow cover was somewhat diminished during mid-January when moderate but warm rains swept over the mountain crests in Central and Northern California. In addition to causing a short period of premature runoff from the snowpack, the rains brought higher elevation snow densities up to about 40%, which is higher than usual for the time of year. This may accelerate early ripening of the snowpack this year. Runoff quantities during January reflected the storm pattern, producing up to 200 percent of normal flows in the northern part of the state, about 130 percent of normal in the central portion, and diminishing to near average in the San Joaquin Valley tributaries. Reservoir storage is excellent throughout the state, benefiting from January's warm rainstorms that produced extensive low elevation snowmelt inflows, especially in central and northern California streams. PHYSICAL PROPERTIES OF ALPINE SNOW AS RELATED TO WEATHER AND AVALANCHE CONDITIONS,
Forest Service (USDA) Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr.
Forest Service Research Paper RM-64, January 1971. 35 p, 18 fig, 6 tab, 34 ref, append.

Descriptors: *Avalanches, *Snowpacks, *On-site tests, *On-site data collections, Sampling, Colorado, Snow management, Safety, Shear strength, Tensile strength, Compressive strength, Stress, Strength of materials, Yield strength, Forecasting, Surveys, Density, Permeability, Weather, Snow.
Identifiers: *Snow physical properties, *Avalanche forecasting.

Data were taken in avalanche starting zones at an elevation of 11,700 feet in Front Range of Colorado within 14 days of deposition. Densities varied from 40 to 450 kg per cu m. A statistical criterion was used to identify snow with unusually high density for its age (initial hard slab) and unusually low (persistent soft snow). Initial hard slab, found in 15 percent of the samples, correlated with moderate to high windspeeds, low temperatures, and presence of wind-transported snow. No good way was found to distinguish initial hard slab from dense older snow. Tensile strength from a spin test varied from 1.0 to 1,712 grams force per sq cm. Strength increased with density but varied greatly for given density. Younger snows tended to be weaker than older snows of the same density. Strength was also measured with shear box and and shear vane. Ram resistance was higher for alpine snow than for snow of the same density in trees. Air permeability varied with the low flow rate used. The ratio of virtual porosity/porosity, which averaged 1.062, was of little value for identifying wind slab. (Knapp-USGS)

2D. Evaporation and Transpiration

EVAPOTRANSPIRATION AND ITS CHEMICAL REDUCTION,
Kansas State Univ., Manhattan. Water Resources Research Inst.
William L. Powers, Gary M. Paulsen, Rosendo K. Palis, Lynn J. Brun, and Edward T. Kanemasu.
Available from the National Technical Information Service as PB-200 823, $3.00 in paper copy, $0.95 in microfiche. KWRRI Contribution No 64, (June 1971), 58 p, 13 fig, 1 tab, 21 ref. OWRR Project B-010-KAN (1).

Descriptors: *Evapotranspiration, *Transpiration, Kansas, *Lysimeters, Microclimate, Photosynthesis.
Identifiers: *Antitranspirants.

This project consisted of a laboratory phase and a field phase. For the laboratory phase several chemicals were screened for their potential in decreasing transpiration. Because transpiration is water evaporation from the stomata of plant leaves, chemicals which partially close the stomata will reduce transpiration. The closure of the stomata may also reduce CO_2 diffusion into the plant and thus may reduce photosynthesis and crop yield. Measurements of both photosynthesis and transpiration were made on plants treated with selected chemicals. Several chemicals appeared promising. For the field phase, two sensitive weighing lysimeters were constructed and various atmospheric sensors assembled on a 5-acre site about 2 miles southwest of Manhattan, Kansas. During the summer of 1970 sorghum and soybeans were planted on this site and the evapotranspiration from these crops characterized. A model for evapotranspiration based on the resistance to vapor diffusion of a single leaf was tested on an hourly basis. (Powers-KWRRI)
W71-09556

EVAPOTRANSPIRATION AND ENERGY BALANCES OF FOREST AND FIELD,
Aberdeen Univ. (Scotland). Dept. of Botany.
S. J. Tajchman.
Water Resources Research, Vol 7, No 3, p 511-523, Jun 1971. 13 p, 2 fig, 7 tab, 48 ref.

Descriptors: *Evapotranspiration, *Crop, *Forests, *Energy budget, *Heat balance, Convection, Heat transfer, Potatoes, Solar radiation, Microclimatology, Micrometeorology, Advection, Heat flow, Vegetation effects.

The energy and water balance components of a 7-year-old Norway spruce forest, a 2-year-old alfalfa field, and a potato field near Munich Germany were computed for the period May-October 1967 by using hourly averages of meteorologic parameters. Turbulent diffusion and energy budget methods were used to determine evapotranspiration and convective exchange. The two methods yielded satisfactory agreement for the low crops but not for the forest. The mean seasonal albedo values for the potatoes and crops but not for the forest. The mean seasonal albedo values for the potatoes and the alfalfa were 0.18 and 0.22, respectively. The albedo of the forest was obtained for

day and averaged 0.05. The shortwave incoming radiation over the forest was 12% less than that over the fields. The net shortwave radiation over the forest was 2 and 7% greater than that over the potatoes and the alfalfa, rexpectively, whereas the long wave emission from the forest was 22 and 15% less than that from the potatoes and the alfalfa, respectively. The total net radiation over the forest was 20% greater than that over the alfalfa and 16% greater than that over the potatoes. Sensible heat flux from the forest was 2.6 and 1.6 times greater than that from the alfalfa and the potatoes, respectively. Evapotranspiration from the forest was 4% less than that from the alfalfa but 14% greater than that from the potatoes. The exchange coefficient at the top of the trees was about 100 times as large as that at the top of the crops. (Knapp-USGS)
W71-09608

A THREE-DIMENSIONAL APPROACH TO THE EXCHANGE OF HEAT AND WATER VAPOR BETWEEN A LARGE WATER BODY AND THE ATMOSPHERE,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
Gour-Tsyh Yeh, and Wilfried Brutsaert.
Available from the National Technical Information Service as PB-201 003, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 30, April 1971, 23 p, 7 fig, 6 tab, 9 ref. OWRR Project A-021-NY (1).

Descriptors: *Turbulence, Diffusion, *Evaporation, Atmosphere, Heat, Water vapor, Heat balance, Heat budget, Turbulent flow.

In the finite difference formulation of the two-dimensional steady state turbulent diffusion equation for solving evaporation problems, two difficulties arise caused by the automatic satisfaction of one of the boundary conditions at the surface and by the infinite size of the solution domain. A general numerical scheme is developed to overcome these difficulties by the use of appropriate transformations. The results of some numerical experiments show that the longitudinal diffusion term is usually negligible and that with suitable parameters for roughness and stability power laws can be as useful for practical solutions as the more complicated logarithmic law.
W71-09739

A STUDY OF WINTERTIME HEAT LOSSES FROM A WATER SURFACE AND OF HEAT CONSERVATION AND HEAT ADDITION TO COMBAT ICE FORMATION IN THE ST. LAWRENCE RIVER,
National Research Labs., Ottawa (Ontario).
F. W. Pruden, R. L. Wardlaw, D. C. Baxter, and J. L. Orr.
Division of Mechanical Engineering, Report No. MD-42, p. 189, June 30, 1954. 34 fig., 13 tab., 112 ref.

Descriptors: *Heat transfer, *Water temperature, *Evaporation, *Solar radiation, *Navigable rivers, Meteorology, Heat flow.
Identifiers: *Ice formation, *Heat addition, *St. Lawrence River, Ice control, Heat loss, Heat conservation.

Re-examination of the technical problems of providing year-round navigation in the St. Lawrence River seaway, ship canal, the gulf and various lake parts are discussed in the present work. A major part of the problem is considered to be the maintenance of navigation in the St. Lawrence River from Lake Ontario to Three Rivers, Quebec, where tidal effects began to be felt. The description of the heat loss process in the river is taken in two parts: (1) formulation of the heat loss rate in a sufficiently simple coefficient form that can be integrated along the length of the river and throughout the season, and (2) the expression of the meteorological statistics as the probability of occurrence of a particular condition at a particular locality. Calculated total heat loss rates were found to be in reasonable agreement with observations under normal conditions. Difficulties of predicting extreme values of heat loss in the design of protection systems are discussed. The design of several systems to extend the navigation season has been examined to determine the parameters to which the design is most sensitive and hence to indicate the most profitable lines of investigation. A rational design procedure for a heater system has been formulated and the order of magnitude of component costs estimated. (Herrera-Vanderbilt)

THE SINUSODIAL FUNCTION OF REGIONAL MONTHLY AVERAGE RELATIVE PAN EVAPORATION,
Tecnion - Israel Inst. of Tech., Haifa. Dept of Civil Engineering; and Water Planning for Israel Ltd., Tel Aviv.
Joseph S. Dalinsky.
Water Resources Research, Vol 7, No 3, p 677-687, June 1971. 11 p, 5 fig, 4 tab, 6 ref.

Descriptors: *Evaporation, *Fourier analysis, Regional analysis, Climatology, Arid lands, Statistical methods, Statistics, Evaporation pans, Seasonal.
Identifiers: *Israel.

An analysis was made of data from 47 stations in Israel at which evaporation had been measured by means of U.S. Weather Bureau class A pans protected by wire mesh. The stations represent different climatic conditions ranging from subhumid to arid. The stations are situated on the Mediterranean coast, in the desert (the Arava Valley), in valleys, in plains, and in mountains. The average relative evaporation in each month was found to be equal at all the stations and could be expressed as a sinusoidal functions. The small deviation from the sinusoidal function make computation of correlations superfluous. As a result of this finding, it is possible to estimate the average evaporation rates for every month and for every location in the country by using one parameter (the amplitude of the sine function) and a map of average annual evaporation depths. (Knapp-USGS)
W71-09814

EVAPORATIVE CAPACITY OF UNSATURATED AIR,
National Weather Service, Rockville, Md. Office of Hydrology.
A. K. Showalter.
Water Resources Research, Vol 7, No 3, p 688-691, June 1971. 4 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Evaporation, *Microenvironment, *Temperature, Vapor pressure, Raindrops, Drops (Fluids), Humidity.
Identifiers: *Evaporative capacity (Air).

Falling water droplets quickly assume surface temperatures equal to the wet-bulb temperature of the air. Formulas for absolute humidity and Ferrel's psychrometric formula are used to develop a simple relationship for calculating the capacity of air to absorb water droplets evaporated into it. Such data may be used for determining water losses during sprinkler irrigation, the discrepancy between radar observed liquid water contents and ground observed rainfall, and other factors important in the hydrologic balance of the atmosphere. The evaporative capacity of the air is determined to be explicitly defined by an equation involving wet-bulb temperature, wet-bulb depression, and atmospheric pressure. (Knapp-USGS)

2E. Streamflow and Runoff

PRELIMINARY REPORT ON THE WATER RESOURCES OF SOUTHEAST MAUI, HAWAII,
Geological Survey, Honolulu, Hawaii.
K. J. Takasaki.
Hawaii Division of Water and Land Development Circular C58, March 1971. 37 p, 10 fig, 3 tab, 13 ref.

Descriptors: *Water resources development, *Groundwater, *Surface waters, *Hydrologic data, *Hawaii, Rainfall-runoff relationships, Springs, Aquifer characteristics, Hydrogeology, Geology, Permeability, Streamflow, Water yield, Water quality, Chemical analysis, Water utilization, Grazing, Livestock, Flow measurement, Perched water, Water storage, Hydrographs.
Identifiers: Maui (Hawaii), Basal water.

Southeast Maui, Hawaii, is about 135 square miles in area and comprises the southern part of Haleakala National Park and the southern slope of Haleakala. The principal land use is low-intensity grazing. Population in 1970 was less than 100. Mean annual rainfall ranges from about 25 inches throughout the central part to about 100 inches near the eastern boundary and to about 50 inches near the western boundary. In about half of the study area, the surface rocks are lava flows of the Kula Volcanic Series. In the other half, the Kula Series is overlain by highly permeable rocks of the Hana Volcanic Series. In most areas where the Hana Series crops out, rainfall absorption is so high and overland runoff so low that stream patterns have not been developed. Where the surface rocks are the less permeable Kula Series, runoff is higher and shallow stream channels have developed. Groundwater occurs as perched water and as basal water and likely as dike-impounded water in rift zones. The principal need for water is for livestock supply. (Woodard-USGS)

AN INVESTIGATION OF FLOODS IN HAWAII THROUGH SEPTEMBER 30, 1970,
Geological Survey, Honolulu, Hawaii.
C. J. Ewart.
Geological Survey Hawaii Basic Data Progress Report 13, March 1971. 166 p, 5 fig, 1 tab.

Descriptors: *Hydrologic data, *Peak discharge, *Hawaii, *Floods, Frequency analysis, Gaging stations, Stream gages, Data collections, Stage-discharge relations, Water levels.
Identifiers: Flood frequency.

Floods--mainly because of the high frequency of intense rainfall--are common in Hawaii. Knowledge of the magnitude and probable frequency of floods is necessary for design of control and conveyance structures, pollution abatement facilities, and planning for use of flood plains. Flood data are obtained through a network of stream-gaging and peak-discharge stations. The crest-stage gage data-collection network, begun on Oahu in 1957, was extended to Hawaii and Kauai in 1962 and Maui and Molokai in 1963. Records of floods from the regular long-term gaging station network augment those from the crest-stage gage network. Records of annual peak stage and discharge at gaging stations through September 30, 1970, and peak discharges at miscellaneous sites, are compiled. At the close of the water year, flood data from 72 regular gaging stations were being supplemented by data from 90 crest-stage gaging stations on Kauai, Oahu, Molokai, Maui, and Hawaii. (Knapp-USGS)

Descriptors: *Rainfall-runoff relationships, *Lake Ontario, *Variability, *Water balance, *Statistics, Data collections, Stream gages, Runoff, Streamflow, Hydrologic budget, Great Lakes Region, Climatic data, Meteorological data, Hydrologic data.
Identifiers: *Runoff variability.

A study of variability of runoff in the Lake Ontario basin was undertaken to provide background information for the International Field Year on the Great Lakes to be held in 1972 on Lake Ontario, because a period of 1 year is a small sample in the life history of a lake basin, and there are large annual fluctuations in the variables in the water balance. Because of a lack of long-term records of measured runoff, the Thornthwaite-Mather water balance model for estimating point runoff from climatic data was used for the 81 stations in and near the basin with records of 15-136 years. Statistical tests show that annual station runoff has a normal distribution. Standard deviations were computed to express variability. Maps of average runoff, as well as plus and minus two standard deviations of runoff, were drawn and permit the estimation of the volumes of annual runoff that can be expected in the Lake Ontario basin. A coefficient of variability of runoff map indicates that the southwestern areas of the basin have the most variable runoff. (Knapp-USGS)

HYDROGEOLOGY OF THE CARBONATE ROCKS OF THE LANCASTER 15-MINUTE QUADRANGLE, SOUTHEASTERN PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
Harold Meisler, and Alvert E. Becher.
Pennsylvania Geological Survey Fourth Series Bulletin W-26, 1971. 149 p, 25 fig, 2 plate, 11 tab, 29 ref.

Descriptors: *Hydrogeology, *Carbonate rocks, *Pennsylvania, *Groundwater, *Aquifer characteristics, Geology, Aquifers, Water wells, Water yield, Specific capacity, Withdrawal, Drawdown, Water quality, Chemical analysis, Hydrologic data, Springs, Streamflow, Groundwater recharge.
Identifiers: *Groundwater resources, Conestoga Valley (Penn), Southeastern Pennsylvania.

Limestone and dolomite strata of Canbrian and Ordovician age underlie the lowlands of the Conestoga Valley in southeastern Pennsylvania. In the Lancaster quadrangle, where the Conestoga Valley attains its maximum width, the carbonate strata are divided into 14 units defined primarily by their relative proportions of limestone and dolomite. Of the 247 wells test pumped for 1-hour, 25% have specific capacities greater than 5.0 gpm per ft--the minimum considered to adequate for public supply and industrial use; 58% have specific capacities greater than 0.5 gpm per ft--the minimum considered to be adequate for small public supply use, and 83% have specific capacities greater than 0.08 gpm per ft-- the minimum considered to be adequate for domestic use. The average discharge of the Little Conestoga Creek at the Conestoga Country Club for the 1964 calendar year was 43 cfs. Approximately 77% of the total streamflow was drived from groundwater discharge. Groundwater in carbonate rocks of the Lancaster quadrangle generally has a specific conductance of between 400 and 700 micromhos per centimeter. (Woodard-USGS)

EVALUATION OF THE MADISON LIMESTONE IN THE WILLISTON BASIN FROM WELL LOGS AND CORES,
Bureau of Mines, Laramie, Wyo., Energy Research Center.
E. J. White, and L. C. Marchant.
Bureau of Mines Report of Investigations 7497, March 1971. 27 p, 14 fig, 4 tab, 14 ref, 2 append.

Descriptors: *Groundwater movement, *Limestones, *Aquifer characteristics, *North Dakota, *Montana, Porosity, Saturation, Core drilling, Sampling, Boreholes, Oil industry, Petrography, Cores, Chemical analysis, Physical properties, Geology, Hydrogeology, Oil-water interfaces, Water chemistry.
Identifiers: *Core analysis, *Log analysis.

Data from oil well logs and core analyses were used to quantitatively evaluate formation porosity and water saturation of heterogeneous carbonates and to study the pore geometry and performance characteristics of cores from these formations. Logs and cores from the Madison limestone from 233 wells in three fields in the Williston basin of North Dakota and Montana were used in the investigation. A comparison of log and core analyses shows that log porosities are consistently larger than core porosities, and the differences are correlatable with core porosity ranges. Water saturations from logs are usually smaller than the corresponding core saturations by summation of fluids, but the difference is attributable to mud filtrate invasion into the cores during drilling. Petrophysical studies show that the low permeabilities and high residual water saturations in these reservoir rocks are due to their fine crystalline texture and complex pore geometry (heterogenity). It is concluded that both log and core analyses must be used for reliable evaluation of these carbonate formations. (Woodard-USGS)

Identifiers: *USSR, *Ukraine, Konka-Yaly depression, Mineralization, Hydrochemistry.

The recharge of aquifers in Bucha, Kiev-Kharkov, and Poltava deposits of the Konka-Yaly depression is accomplished by groundwater flow from the fissure zone of crystalline rocks of the Azov Sea massif through zones of fractures, which outline the depression on the south and east. Demineralization of the waters during groundwater infiltration through these zones results in fresh waters with a mineralization of 0.4-1.0 g/liter. Demineralization of the waters of the region may be associated with a periodic regeneration of the absorption capacity of clays in the zones of tectonic fractures. This process may be the result of (1) the formation of new clay particles owing to continual weathering of the crystalline rocks of the massif, (2) seasonal fluctuations in the amount of soluble salts in the waters and (3) a change in the acidity of inflowing waters depending upon the time of year. FFECT OF PHYSICAL PROPERTIES OF OROUS MEDIA ON WATER MOVEMENT,
aho Univ., Moscow. Dept. of Agriculture and o-Resources Engineering.
L. Bloomsburg, and W. M. Carson.
vailable from the National Technical Information rvice as PB-201 001, $3.00 in paper copy, $0.95 microfiche. Technical Completion Report, Sepmber 1970, 20 p, 5 fig, 11 ref. OWRR Project A-5-IDA (2).

Descriptors: *Permeability, Hydraulic conductivity, *Porous media, *Darcy's law, Saturated flow, *Groundwater.

Theoretical and experimental work was conducted to determine the effect of various physical properties of porous media on permeability. The theoretical work involved obtaining a solution for a linearized but complete form of the Navier Stokes equation for flow around a sphere in a rectangular array of spheres. The linearization involved making Oseen's approximation for the convective acceleration terms. The Galerkin method was used and the solution was valid up to a Reynolds number of about 10. The experimental and analytical work showed that the Darcy equation could be used over the entire range of Reynolds numbers as long as it is realized that in the so-called non-Darcy range the coefficient of permeability is dependent on Reynolds number. Experimental data are given for the permeability of various porous materials as a function of Reynolds number with porosity as a parameter.

USE OF THE FINITE-ELEMENT METHOD IN THE SOLUTION OF DIFFUSION-CONVECTION EQUATIONS,
Texaco Inc., Bellaire, Tex.
Y. M. Shum.
Society of Petroleum Engineers Journal, Vol 11, No 2, p 139-144, June 1971. 6 p, 4 fig, 11 ref.

Descriptors: *Diffusion, *Convection, *Porous media, *Mass transport, *Heat flow, Mathematical studies, Variability, Numerical analysis, Groundwater movement.
Identifiers: *Finite difference method.

A variational principle usually applied to the transient heat conduction equation with heat-flux boundary conditions, with a slight modification of the solution technique, is also applicable to diffusion-convection equations. Consideration is given to a one-dimensional transport problem with dispersion in porous media. The finite-element method is employed to reduce the continuous spatial solution into a finite number of time-dependent unknowns. The method can readily be applied to solve problems involving either linear or nonlinear boundary conditions, or both. Results using the finite-element method are compared with several standard finite-difference numerical solutions. The finite-element method is shown to yield satisfactory solutions. (Knapp-USGS)

Descriptors: *Saline water intrusion, *Saline water-freshwater interfaces, *Numerical analysis, Dupuit-Forchheimer theory, Groundwater movement, Tides, Tidal effects, Water table, Hydraulic conductivity, Permeability, Computer programs, Unsteady flow.
Identifiers: Coastal aquifers.

The partial differential equations that describe the motion of the seawater interface and the free surface in a phreatic coastal aquifer (or the freshwater head replacing the latter, in the confined case) are presented. They are based on the Dupuit approximation and take into consideration the geometry of the vertical section through the aquifer, in whose plane the flow takes place, as well as the spatial variation of properties of the porous medium and the spatial and temporal distributions of accretion, recharge, and pumping. An implicit numerical scheme is presented to solve the set of simultaneous partial differential equations. The scheme is based on a linearization of the equations and employs a grid with one spacing over the intrusion length and a different spacing in the remainder of the field. Efficient solution of the resulting set of simultaneous linear equations for each time step is achieved by arranging them in a way that results in a 7 diagonal coefficient matrix. Examples are presented, for which the numerical solutions are compared with analytical solutions or laboratory experiments. (Knapp-USGS)

Identifiers: *Australia, *Regional hydrodynamics.

The decision whether to continue petroleum exploration of a sedimentary basin when only marginally attractive oil and gas discoveries have been made is a difficult one, which can be assisted by the application of an appropriate fluid flow model. The pertinency of the Toth-Freeze-Witherspoon model has been proved in the western Canada sedimentary basin, and is now applied to the less explored Surat basin, Australia. The Surat basin consists of a narrow north trending trough filled with Paleozoic strata overlain by a thick, broad cover of Mesozoic sedimentary rocks. Hydraulic head maps and cross sections indicate that hydrocarbon accumulations are associated with quasistagnant portions of discharge areas in which flow is vertical with respect to the bedding, the result being increased salinity of the formation waters caused by membrane filtration and consequently conditions more favorable for the disaccommodation and subsequent accumulation of hydrocarbons. Although the detailed delineation of favorable areas in the Surat basin is difficult with the data presently available, the concepts and approach applied in this paper may be of value to those seeking hydrocarbon accumulations in sedimentary basins throughout the world. SEEPAGE THROUGH UNCONFINED AQUIFERS WITH LOWER BOUNDARIES OF ANY SHAPE,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. G. Youngs.
Water Resources Research, Vol 7, No 3, p 624-631, June 1971. 8 p, 8 fig, 8 ref.

Descriptors: *Groundwater movement, *Seepage, *Underseepage, *Aquicludes, Dams, Canals, Canal seepage, Soil water movement, Saturated flow, Unsaturated flow, Equations, Porous media, Hydraulic conductivity, Water table, Saline water intrusion, Boundary processes, Dupuit-Forchheimer theory, Stratified flow.
Identifiers: Unconfined aquifers.

Seepage through unconfined aquifers with lower boundaries of any shape is analyzed. The differential equation describing the flow includes a term that involves the pressure distribution on the lower boundary. Although in many problems all the required pressure distribution that enable the seepage problem to be solved are not known exactly, inspection of a given problem gives extreme values of any unknown terms with a final result of known precision. The application of the analysis, checked by electric analog experiments, is illustrated by two examples of seepage problems: first,

the seepage over an inclined plane between two parallel ditches; and second, the seaward flow of freshwater fed by a freshwater reservoir or by rainfall and supported on saline water from the sea. (Knapp-USGS)

USE OF HARMONIC ANALYSIS TO STUDY TIDAL FLUCTUATIONS IN AQUIFERS NEAR THE SEA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
P. A. Carr.
Water Resources Research, Vol 7, No 3, p 632-643, June 1971. 12 p, 6 fig, 8 tab, 15 ref.

Descriptors: *Surface-groundwater relationships, *Tides, *Aquifer characteristics, *Groundwater movement, *Fourier analysis, Waves (Water), Hydraulic conductivity, Permeability, Confined water, Hydrogeology, Time lag.
Identifiers: *Aquifer tests, Harmonic analysis, *Prince Edward Island.

Sixteen days of water level records were collected from a tidal gage and from four wells situated in a line perpendicular to the shore at Borden, Prince Edward Island, Canada. These two sets of records were separated by harmonic analysis into three tidal components. In a confined aquifer, groundwater flow obeys linear potential theory so that each directional component represents a distinct hydraulic conductivity and specific storage test on the aquifer. The use of a line of wells permits the determination of the effective distance and an accurate determination of true tidal efficiency by two different plots. The values of hydraulic conductivity determined this way agree very closely with the values determined by packer tests on nearby wells. The unseparated composite wave was analyzed by using the maxima and minima from four days of records and by assuming a periodicity of 745 minutes. The calculated values of aquifer parameters differed very little from those determined by the individual components. The individual analyses can however produce large errors because they do not permit an accurate determination of the effective distance. (Knapp-USGS)

ANALYSIS OF NONSTEADY FLOW WITH A FREE SURFACE USING THE FINITE ELEMENT METHOD,
Volcani Inst. of Agricultural Research, Bet Dagan (Israel); and California Univ., Berkeley. Dept. of Civil Engineering.
Shlomo P. Neuman, and Paul A. Witherspoon.
Water Resources Research, Vol 7, No 3, p 611-623, June 1971. 13 p, 7 fig, 33 ref.

Descriptors: *Unsteady flow, *Groundwater movement, *Water table, *Numerical analysis, *Saturated flow, Mathematical models, Drawdown, Aquifers, Aquifer characteristics, Computer programs, Withdrawal, Water storage, Groundwater recharge, Specific yield, Porous media, Permeability, Storage coefficient, Discharge (Water), Mathematical studies.
Identifiers: Nonsteady free surface flow, Finite element method.

A new iterative, numerical approach to nonsteady flow of groundwater with a free surface using the finite element method has been developed. The method is unconditionally stable and therefore requires only a small number of time steps to reach the steady state. It can handle problems in which the free surface is discontinuous and portions of the free surface are vertical or nearly vertical. Infiltration or evapotranspiration at the free surface is handled with ease, and the effect of the unsaturated zone can be taken into account indirectly by using the concept of delayed yield from storage. In addition to gravity drainage, the method takes into consideration storage due to the elastic properties of the saturated porous medium. In problems involving flow to a well operating at a prescribed rate, both storage in the well and the actual distribution of velocities along the well bore are taken into account. The method can be applied to a wide variety of problems involving complex boundaries and arbitrary degrees of heterogeneity and anisotropy. Several examples are included to demonstrate some of the features of this new approach. (Knapp-USGS)

Descriptors: *Diffusion, *Soil water movement, *Statistical methods, *Mass transfer, Soil physical properties, Soil chemistry, Monte Carlo method, Pesticide residues, Path of pollutants, Frozen soils, Ion transport.

A special Monte Carlo method for use in investigating problems which involve random processes is developed. This approach differs from the usual Monte Carlo method for solution of differential equations in that the random process itself is constructed directly. The power of this approach is demonstrated by application of the method using two examples. In one case, the effect of thermal gradient on ionic diffusion through thin films of interfacial water in frozen clay is examined. The predicted ionic distribution is in agreement both with experimental data and with the result obtained by exact solution of the diffusion equation. In the second example, the distribution of acetone deposited in soil near the soil-atmosphere interface is calculated for a two-layer profile in which the adsorption coefficient and void-porosity vary between horizons. Identifiers: Soil salinity.

Soil columns containing either Yolo silty clay loam or Hanford sandy loam were prepared with vertically nonuniform salt (Na, Ca, Mg, Cl) and moisture distributions and with gypsum present in the surface soil. The columns were irrigated at both fast and slow rates of water application with a water containing Na, Ca, Mg, and Cl. A simple method for calculating salt movement in soils successfully approximated the resultant salt profiles. A variation in the salt movement computation method was devised for calculating the leaching required to lower the salinity of a particular soil depth to less than a specified value. The method was experimentally verified on both a Yolo and a Hanford soil column, each with vertically nonuniform initial salt and moisture distributions. (Knapp-USGS)

INTRODUCTION TO SYMPOSIUM--THE SOIL SOLUTION,
Agricultural Research Service, Auburn, Ala. Soil and Water Conservation Research Div.
Robert W. Pearson.
Soil Science Society of America Proceedings, Vol 35, No 3, p 417-420, May-Jun 1971. 4 p, 7 fig, 1 tab, 13 ref.

Descriptors: *Conferences, *Soil water, *Soil chemistry, *Water chemistry, Soil-water-plant relationships, Soil environment, Aqueous solutions, Chemical potential.
Identifiers: *Soil solution.

During the 1970 annual meeting of SSSA, August 23-28, at the University of Arizona, Tucson, a symposium was held on the subject of the soil solution. The symposium program consisted of seven papers by society members who have been concerned for many years with the need to clarify the role which the soil solution plays in the chemical reactions within the soil and its contribution to plant growth. Evidence is presented for validity of the concept of soil solution composition as a useful reflection of soil chemical environment that can be related to plant-root growth. Analysis of soil extracts does not give the same information. Sample of the soil solution can be obtained by displacement at any desired moisture level. (Knapp-USGS)

IONIC CONCENTRATIONS AND ACTIVITIES IN THE SOIL SOLUTIONS,
Auburn Univ., Ala. Dept. of Agronomy and Soils.
Fred Adams.
Soil Science Society of America Proceedings, Vol 35, No 3, p 420-426, May-Jun 1971. 7 p, 4 tab, 1 ref.

Descriptors: *Water chemistry, *Soil water, *Soil chemistry, *Aqueous solutions, Hydrolysis, Ions, Chemical reactions, Mineralogy, Computer programs, Chemical potential.
Identifiers: *Soil solutions.

The chemical composition of displaced soil solutions is used to illustrate the procedure for correcting measured ionic concentrations to actual ionic concentrations and ionic activities. The procedure distributes soil-solution electrolytes at equilibrium among their various ionic species by using equations for ion-activity coefficients, ion-pair dissociation, weak-acid and weak-base dissociation, and hydrolysis. More than 20 related equations had to be solved simultaneously; thus, mathematical solution was effected through the method of successive approximation. Rapid correction of soil-solution analytical data to actual concentrations and activities of individual soil-solution ions was made possible by using a computer program. (Knapp-USGS)

A STUDY OF WEATHERING IN A SOIL DERIVED FROM A BIOTITE-HORNBLENDE ROCK, I. WEATHERING OF BIOTITE,
Macaulay Inst. for Soil Research, Aberdeen (Scotland).
M. J. Wilson.
Clay Minerals, Vol 8, No 3, p 291-303, July 1970. 13 p, 4 fig, 1 plate, 4 tab, 25 ref.

Descriptors: *Soil formation, *Weathering, *Clay minerals, *Ion exchange, *Leaching, Differential thermal analysis, Magnesium, Iron, Adsorption, Chemical analysis, Mineralogy.
Identifiers: *Mica weathering.

The weathering of biotite in a sedentary soil profile developed on biotite-hornblende-rock near Rehiran, Inverness-shire, Scotland, was investigated by optical, X-ray, chemical, infrared and differential thermal methods. In the C horizon a direct transformation to hydrobiotite was observed. This involves oxidation of all the ferrous iron present and subsequent movement of ferric ions from the octahedral sheet. In the B horizon weathering proceeds to a fully expanded 14A phase and this was identified as interstratified vermiculite-chlorite in a 1:1 ratio. Chemical analysis indicates that this stage is accompanied by a substantial addition of magnesium, much of which goes to form the brucite-like interlayers. In the more acid surface horizon these interlayers tend to break down thus yielding a more vermiculitic product. The possible general implications of this type of biotite weathering are briefly discussed. (See also W71-09636) (Knapp-USGS)

A STUDY OF WEATHERING IN A SOIL DERIVED FROM A BIOTITE-HORNBLENDE ROCK, II. THE WEATHERING OF HORNBLENDE,
Macaulay Inst. for Soil Research, Aberdeen (Scotland).
M. J. Wilson, and V. C. Farmer.
Clay Minerals, Vol 8, No 4, p 435-444, December 1970. 10 p, 6 fig, 3 tab, 18 ref.

Descriptors: *Weathering, Soil formation, *Leaching, *Ion exchange, *Clay minerals, Clays, Soil chemistry, Mineralogy, Expansive clays, Chemical reactions.
Identifiers: Biotite, Hornblende.

The weathering of hornblende was investigated by optical, X-ray, infrared and differential thermal methods. Optical studies of the fresh hornblende show that it contains discrete lamellar intergrowths of another amphibole which, from infrared evidence, is of an iron-rich nature. This minor phase is selectively weathered in the lower horizons and yields a clay mineral which was identified as interstratified swelling chlorite-saponite. The major hornblende component remains relatively unchanged. Single crystal photographs indicate that the formation of the clay mineral is not structurally controlled by the parent hornblende, although there is a tendency towards alignment along cleavage planes. The clay mineral becomes unstable in the upper part of the profile and could not be detected in the A horizon. (See also W71-09635) (Knapp-USGS)
W71-09636

THE ADSORPTION OF POLY (ETHYLENE GLYCOLS) ON CLAY MINERALS,
Adelaide Univ. (Australia). Waite Agricultural Research Inst; and Adelaide Univ. (Australia). Dept. of Agricultural Biochemistry and Soil Science.
R. L. Parfitt, and D. J. Greenland.
Clay Minerals, Vol 8, No 3, p 305-315, July 1970. 11 p, 5 fig, 4 tab, 17 ref.

Descriptors: *Adsorption, *Clay minerals, *Alcohols, Free energy, Cation exchange, Cesium, Sodium, Calcium, Aluminum, Ion exchange, Hydration.
Identifiers: Poly (Ethylene glycols).

Poly (ethylene glycols) of molecular weights 200 to 2000 were strongly adsorbed on montmorillonite from aqueous solution. Free energies of adsorption calculated from the adsorption isotherms became more negative with increase in molecular weight and the entropy change became increasingly positive, probably due to a net desorption of water from the clay surface as the organic compound was adsorbed. The adsorption of the higher molecular weight polymers caused an increase in the interlamellar separation. The effect of the exchangeable cation on the adsorption followed the order Cs, Na, Ca, Al, indicating that the cation retained its hydration shell and did not form a direct association with the adsorbed organic molecules. Some evidence was obtained that 'water bridges' were formed between exchangeable calcium an aluminium ions and the ether groups of the polymers. (Knapp-USGS)
W71-09637

ADSORPTION OF WATER BY MONTMORILLONITE - POLY (ETHYLENE GLYCOL) ADSORPTION PRODUCTS,
Adelaide Univ. (Australia). Waite Agricultural Research Inst., and Adelaide Univ. (Australia). Dept. of Agricultural Biochemistry and Soil Science.
R. L. Parfitt, and D. J. Greenland.
Clay Minerals, Vol 8, No 3, p 317-324, July 1970. 8 p, 4 fig, 2 tab, 18 ref.

Descriptors: *Adsorption, *Clay minerals, *Alcohols, Free energy, Cation exchange, Cesium, Sodium, Calcium, Aluminum, Ion exchange, Hydration.
Identifiers: Poly (Ethylene glycols).

Water adsorption by interlamellar complexes of poly (ethylene glycols) (PEG) and montmorillonite has been determined using a silica spiral spring, and supplementary data obtained by X-ray and infrared techniques. The adsorbed water enters the interlamellar region, where it is associated with the exchangeable cation. The lattice swells to accommodate the intercalated water. Only weak hydrogen bonds are formed between the surface of the clay and the adsorbed water or between adsorbed PEG molecules and adsorbed water. The presence of PEG did not prevent extensive swelling of sodium montmorillonite. (Knapp-USGS)
W71-09638

THE FORMATION OF STABLE SOLS FROM LAPONITE, A SYNTHETIC HECTORITE-LIKE CLAY,
Laporte Industries Ltd., Redhill (England).
B. S. Neumann, and K. G. Sansom.
Clay Minerals, Vol 8, No 4, p 389-404, December 1970. 16 p, 18 fig, 5 tab, 2 ref.

Descriptors: *Clay minerals, *Suspension, *Colloids, *Electrolytes, *Expansive clays, Gels, Phosphates, Water chemistry.
Identifiers: *Sols.

The effects of simultaneous additions of electrolyte and peptizer to dispersion of the synthetic hectorite-like clay, Laponite, have been studied. Unexpectedly, whereas many cations cause gelling and flocculation of the dispersions as expected by col-

loid chemical theory, some cations actually stabilize the sols obtained with peptizer. A relationship was found between the effectiveness of the cations in increasing sol stability and their size and charge. The effects of time, temperature and peptizer concentration was examined. The explanations offered for this phenomenon are based on the idea that the stabilizing cations cause oriented flocculation and, consequently, a reduction of the number of particles available for structure formation. (Knapp-USGS)

LIMITATIONS ON SCALING BY CONTACT ANGLE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. R. Philip.
Soil Science Society of America Proceeding, Vol 35, No 3, p 507-509, May-June 1971. 3 p, 2 fig, 8 ref.

Descriptors: *Infiltration, *Wetting, *Soil water movement, Capillary water, Soil physical properties, Model studies.
Identifiers: Contact angle (Capillary), Hydraulic scaling.

The prevalent notion that the (static and dynamic) behavior of liquids in porous media such as soils may be scaled by the contact angle depends on the over-simplication that such media are bundles of long cylindrical capillaries. Observations on such media yield, at best, apparent contact angles which cannot be related directly to contact angle at interfaces within the medium. In some circumstances scaling by apparent contact angle may hold approximately, but this is of only limited value, since apparent contact angle depends not only on the true liquid-solid contact angle, but also on properties of the internal geometry of the medium. These matters are illustrated through the counter-example of a (somewhat more realistic) conical-pore model. (Knapp-USGS)
W71-09806

EXTRACTION OF ANIONS AND CATIONS FROM RECENT VOLCANIC ASH,
Inter-American Inst of Agricultural Sciences, Turrialba (Costa Rica). Research and Training Center.
Elemer Bornemisza.
Soil Science Society of America Proceedings, Vol 35, No 3, p 506-507, May-June 1971. 2 p, 1 fig, 1 tab, 4 ref. USAEC Contract AT (30-1)2043

Descriptors: *Leaching, *Anion exchange, *Volcanoes, Soil chemistry, Water chemistry, Calcium, Magnesium, Sodium, Manganese, Sulfates, Silicates, Ion transport, Salts, Soil water, Solubility.
Identifiers: *Volcanic ash.

Water extracts of ash from Mt. Arenal, Costa Rica's most recently active volcano, contained up to 32 ppm Ca, 3.3 ppm Mg, 4ppm K, 4 ppm Na, and 0.4 ppm Mn.No phosphates were extracted by water, but sulfates reached 35 ppm and silicates 1.6 ppm in the extracts. The sample farthest away from the volcano gave extracts of lowest Ca and Mg content. The pH of diluted NaOH suspension of ash decreased on standing by up to 1.5 pH units. (Knapp-USGS)
W71-09807

FURROW INFILTRATION RATES AS AFFECTED BY INCORPORATION OF STRAW OR FURROW CULTIVATION,
Agriculture Research Service, Prosser, Wash. Soil and Water Conservation Research Div.
D. E. Miller, and J. S. Aarstad.
Soil Science Society of America Proceedings, Vol 35, No 3, p 492-495, May-June 1971. 4 p, 1 fig, 4 tab, 8 ref.

Descriptors: *Infiltration, *Mulching, *Furrow irrigation, *Soil structure, *Cultivation, Soil management, Water utilization, Irrigation water, Furrows, Irrigation practices, Soil treatment.
Identifiers: Furrow infiltration.

Either straw incorporation or cultivation of the furrow bottom greatly increased furrow infiltration into a sandy loam soil during a 3-year study period. Straw incorporation became less effective as the season progressed. A single straw application of 13.4 tons/ha lasted until midway into the second irrigation season. The cultivation treatment caused serious erosion when furrow inflow rates were about 6 liters/min or more. The straw prevented erosion at all inflow rates (up to 8 liters/min). Organic matter contents were significantly increased by the incorporation of straw. Aggregate stabilities followed the same trend, but differences were not statistically significant. (Knapp-USGS)
W71-09808

EFFECT OF ADDED SALT ON NITROGEN MINERALIZATION IN THREE CALIFORNIA SOILS,
California Univ., Davis. Dept. of Soils and Plant Nutrition.
F. E. Broadbent, and T. Nakashima.
Soil Science Society of America Proceedings, Vol 35, No 3, p 457-460, May-June 1971. 4 p, 4 fig, 5 tab, 5 ref.

Descriptors: *Nitrogen fixation, *Chemical precipitation, *Nitrogen compounds, *Soil chemistry, *Soil water, Water chemistry, Ammonia, Sulfates, Chlorides, Calcium, Potassium.
Identifiers: *Nitrogen mineralization.

The effect of ammonium sulfate, ammonium chloride, potassium chloride, calcium chloride, aluminum chloride, and copper sulfate, added in amounts corresponding to 0.2, 2, and 20 atm concentration, on mineralization of soil nitrogen in three soils was measured over a 30-day period. Significant increases were produced by the ammonium salts which were labeled with N-15 to allow distinction between added and soil nitrogen. In Aiken clay loam, nitrogen mineralization was also increased by solutions of potassium chloride, calcium chloride, and aluminum chloride, but in Altamont clay loan and in Mormon clay, increases were not consistent. Copper sulfate depressed nitrogen mineralization in all soils. The quantity of organic nitrogen brought into solution was related to the concentration of salt solution. (Knapp-USGS)
W71-09809

THE ROLE OF SPARINGLY SOLUBLE SOLIDS AND CATION EXCHANGE REACTIONS IN CONTROLLING CONDITIONS IN SOIL SOLUTIONS,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
R. C. Turner, and S. Shad Singh.
Soil Science Society of America Proceedings, Vol 35, No 3, p 445-449, May-June 1971. 5 p, 2 fig.

Descriptors: *Aqueous solutions, *Water chemistry, *Solubility, *Soil water, Soil chemistry, Chemical potential, Aluminum, Ion exchange, Clay minerals, Equilibrium, Hydrolysis.
Identifiers: Aluminum hydroxides, *Solubility product, Soil solution.

The application of the principle of solubility products of relatively insoluble solids and exchange reactions to soil problems are discussed. The examples used concern the solubility products of hydroxyaluminum solids, whether thermodynamically stable or metastable, and exchange reactions with clay surfaces involving aluminum and calcium ions. RADIATION REGIME OF LAKES AND RES VOIRS (Russian: Radiatsionnyy rezhim oze vodokhranilishch),
T. V. Kirillova.
Leningrad, Gidrometeoizdat, 1970. 253 p, 67 132 tab, 331 ref.

Descriptors: *Radiation, *Albedo, *Bodies water, *Lakes, *Reservoirs, Solar radiation, S Cloud cover, Meteorological data, Climatolo Air temperature, Atmosphere, Atmosphe physics, Humidity, Coasts, Weather data, Air-w interfaces, Air-earth interfaces, Heat bala Seasonal.
Identifiers: *USSR, Volgograd reserv Novosibirsk reservoir, Lake Sevan, Radiat balance, Water surface, Total radiation, Effec radiation, Radiometers, Actinometry.

Contrary to popular belief, the total radiat above reservoirs and lakes during a summer pe is greater than that above coastal areas. The ference is approximately 5% and may be attribu to the presence of fewer clouds and a greate mospheric transparency above water bodies. observed values of albedo exceed the theoretic computed values whenever the altitude of the su greater than 30 deg and are smaller than the c puted values when the altitude of the sun is than 30 deg. Changes in absorbed and effec radiation point to their close relationship reveal their dependence upon the sun's altitud method is given for determining the water surf temperature, air temperature, and humidity ab a water body based on meteorological observat on the shore. The method makes it possible to culate the radiation balance of planned w bodies of various depth and size and to refine q titative descriptions of the hydrometeorolog regime of lakes and reservoirs. 2I. Water in Plants

FLUORESCENT DYES, THEIR UPTAKE AND TANSLOCATION IN PLANTS,
Geological Survey, Menlo Park, Calif. Water Resources Div.
D. E. Donaldson, and T. W. Robinson.
Water Resources Research, Vol 7, No 3, p 692-696, June 1971. 5 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Tracers, *Dye releases, *Soil-water-plant relationships, *Tracking techniques, Fluorometry, Absorption, Moisture uptake, Translocation.
Identifiers: *Fluorescent dyes.

Of seven fluorescent dyes tested, rhodamine WT (RWT) and pontacyl brilliant pink (PBP) were the only two found to be suitable for tracer studies of water movements in plants. The results indicate that RWT is superior to PBP. The dyes were introduced in the aqueous form into the root zone of plants and were rapidly absorbed and transported to the leaves. The dosages were 1, 2, and 5 grams of dye per 32 kg of soil. With the largest dosage, the dye could be observed visually in the leaves. The concentrations of dye per gram of plant tissue ranged from 5 micrograms of PBP in oleander plants to 323 micrograms of RWT in fir plants. The time that elapsed from introduction of the dye into the soil until its detection in the leaves varied from 4 to 24 hours. Neither RWT nor PBP had produced any observable adverse effects when the plants were inspected up to 160 days after injection. Interference by the plant material in measuring the dye concentration was not a problem. (Knapp-USGS)

THE SLOPE OF ABYSSAL PLAINS,
Flinders Univ., Bedford Park (Australia). Horace Lamb Center for Oceanographical Research.
John A. T. Bye.
Journal of Geophysical Research, Vol 76, No 18, p 4188-4194, June 20, 1971. 7 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Continental slope, *Sedimentation, *Slopes, *Density currents, *Turbidity currents, Suspended load, Sediment transport, Topography, Geomorphology, Mathematical models, Slope stability, Sedimentary structures, Oceanography.
Identifiers: *Abyssal plains.

If the abyssal plains have been formed by the transport of material in suspension flows, the slopes of the plains must be consistent with the dynamics of the flows. A solution of the momentum and conservation equations predicts a critical bottom slope below which the slopes are not self-sustaining in the presence of bottom friction even for particles with negligible fall speed. Two types of flow, in which either the depth or the concentration is held constant, both yield critical slopes of the order 1/1000. It appears that for slopes less than this value deposition of material must occur. The region of deposition may be shown to extend at least a few hundred kilometers. Thus suspension flow provides a suitable mechanism for the formation of surfaces with the observed range of abyssal slopes. (Knapp-USGS)

DOES UPWARD DIFFUSION SUPPLY THE EXCESS MANGANESE IN PELAGIC SEDIMENTS,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
Michael L. Bender.
Journal of Geophysical Research, Vol 76, No 18, p 4212-4215, Jun 20, 1971. 4 p, 3 fig, 1 tab, 17 ref.

Descriptors: *Manganese, *Bottom sediments, *Diffusion, *Sediment-water interfaces, *Water chemistry, Connate water, Sedimentation, Mixing, Dispersion, Porous media.

Simple calculations indicate that upward diffusion of Mn through pelagic sediment pore water can supply manganese at the rate it has been observed to accumulate in pelagic sediments (about 1 mg per sq cm per thousand years) only if manganese needs to be transported less than a meter or so in the sediment column. Data for manganese concentrations of sediment versus depth in the core indicate that the average thickness of the manganese-rich zone of pelagic sediments is at least 10 meters; therefore upward diffusion does not supply a large portion of the 'excess' manganese in most manganese-rich pelagic sediments. (Knapp-USGS)

CONSEQUENCES OF HISTORIC RAINFALL ON WESTERN IOWA FARMLAND,
Agricultural Research Service, Columbia, Mo. Soil and Water Conservation Research Div.
R. G. Spomer, H. G. Heinemann, and R. F. Piest.
Water Resources Research, Vol 7, No 3, p 524-535, Jun 1971. 12 p, 6 fig, 4 tab, 4 ref.

Descriptors: *Iowa, *Soil erosion, *Rainfall-runoff relationships, *Sheet erosion, *Erosion control, Storm runoff, Topography, Gully erosion, Historic flood, Cloud bursts, Cultivated lands, Damages, Land management, Sediment yield, Contour farming, Land forming, Terracing, Water control.
Identifiers: *Historic storm (Iowa).

Rainfall on five soil and water conservation watersheds near Treynor, Iowa, varied from 18 to 22 inches for the period of May 28 to June 27, 1967. This unique series of events has a return period that exceeds 100 years, based on the 97-year Weather Bureau record at nearby Omaha, Nebraska. Surface runoff from two corn cropped watersheds planted on an approximate contour approached or exceeded 50% of the storm rainfall during the period. Surface runoff was 8% or less for all rainfall events on a corn cropped, terraced watershed and 17% or less for all but one storm on a grassed watershed. These rains occurred a few weeks after planting when the corn crops were only 6 inches tall; consequently, little or no erosion protection was provided for the bare, loose soil. Sheet rill erosion rates were 75 to 100 tons per acre on the contoured watersheds. By contrast, conservation practices on two other watersheds limited the sheet rill erosion to 2.5 tons per acre. Gullies on the contoured corn watersheds eroded severly, whereas conservation practices on the other watersheds reduced gully erosion to an insignificant amount. (Knapp-USGS)

TRANSVERSE EROSIONAL MARKS OF MUD AND ROCK: THEIR PHYSICAL BASIS AND GEOLOGICAL SIGNIFICANCE,
Reading Univ. (England). Sedimentology Research Lab.; and Reading Univ. (England). Dept. of Geology.
J. R. L. Allen.
Sedimentary Geology, Vol 5, No 3-4, p 167-385, May 1971. 219 p, 106 fig, 441 ref, 11 tab.

Descriptors: *Sedimentary structures, *Ripple marks, *Scour, *Erosion, Turbidity currents, Open channel flow, Sedimentation, Waves (Water), Beaches, Sediment transport, Channel morphology, Bed load, Bottom sediments, sediment-water interfaces, Mass transfer, Aqueous solutions, Paleohydrology, Sedimentology.
Identifiers: *Transverse erosional marks.

Transverse erosional marks of interest in the earth sciences are described and classified as individual structures and as assemblages on the basis of their field occurrence and character. A theoretical and experimental investigation is made into the physical nature of the hydrodynamic and mechanical processes involved in their production, with particular reference to the flutes and scallops produced by solution in limestone caves, and to the scour and flute marks generated on mud beds by aqueous streams, notably turbidity currents, through corrasion and fluid-stressing. The association of transverse erosional marks with separated flows is established and the relevance of the properties of these flows to the shape and growth of the marks is demonstrated in detail. Alternative explanations of the size, shape and pattern of erosional marks are considered, and the changes in these properties down a turbidity current path are explored. No single theory of size, shape and pattern yet exists, though some generalizations are possible. Erosional marks generated on limestone surfaces by solution and on strong mud beds by corrasion depend for character on the defects existing in the bed, the duration of the eroding process, and the flow properties. However, structures produced by the fluid-stressing of weakly cohesive mud beds depend on flow properties alone. In both cases inferences of importance to environmental interpretations can be made from measurable properties of the structures. (Knapp-USGS)

THE DIFFERENTIAL THERMAL ANALYSIS OF FLOCCULATED CLAY SAMPLES,
Salford Univ. (England).
D. Dollimore, G. R. Heal, and T. A. Horridge.
Clay Minerals, Vol 8, No 4, p 479-486, December 1970. 8 p, 4 fig, 2 tab, 3 ref.

Descriptors: *Kaolinite, *Flocculation, *Aqueous solutions, *Organic compounds, *Differential thermal analysis, Gels, Colloids, Suspension, Sedimentation, Analytical techniques, Mineraology, Clays, Particle size.

Clays may be flocculated from suspension by various polymeric flocculating agents. In this study the technique of differential thermal analysis is used to identify the flocculating agent and to study its behavior when adsorbed on the clay particles. It is shown that the clay particles display normal properties on sedimenting in the presence of sufficient polymer to cause flocculation. The differential thermal analysis trace for clays is only affected when the flocculating agent is present on the surface in quantities in excess of that required for effective sedimentation. Descriptors: *Reservoirs, *Bank erosion, *Scour, *Deformation, *Forecasting, Geomorphology, Erosion, Bank stability, Probability, Rocks, Slopes, Profiles, Waves (Water).
Identifiers: *USSR, *European USSR, Gor'kiy Reservoir, Volgograd Reservoir, Tsimlyansk Reservoir.

The dimensions of three large reservoirs in the European USSR are given and the nature of their banks briefly described. Bank erosion forecasts are made for 8 calculated profiles of the reservoirs--one for the Tsimlyansk reservoir, three for the Volgograd reservoir and four for the Gor'kiy reservoir. A comparison of observed bank erosions with those calculated by a method worked out at the State Hydrological Institute (SHI) shows an average deviation of 31% of the most probable scour with fluctuations ranging from 11 to 43%, which approximates the accuracy possible in such morphological calculations. In 5 of 8 cases examined the bank line displacement either occurred within the limits of potential erosion in the probability range of 1 to 99% or exceeded them by 1 to 3 m. In two instances the actual bank line displacement exceeded the upper limit of 1% probability by 6 m and only in one case did it exceed the upper limit by 15 m. In all cases the period of bank erosion observations was far below the minimum forecast period of record of 12.5 years stipulated by the SHI method. (Josefson-USGS)

SOIL PIPING AND STREAM CHANNEL INITIATION,
Experimental Cartography Unit, London (England).
Anthony Jones.
Water Resources Research, Vol 7, No 3, p 602-610, June 1971. 9 p, 3 fig, 2 tab, 41 ref.

Descriptors: *Soil water movement, *Surface-groundwater relationships, *Bank erosion, *Soil erosion, *Sand boils, Seepage, Percolation, Banks, Permeability stream erosion, Bank stability, Channel erosion.
Identifiers: *Soil piping.

Soil piping has been associated primarily with drylands, yet evidence of piping is available from a large range of climatic regions; in particular, it is found to be widespread in the United Kingdom. Preferred locations for piping are either just above or within a horizon of low relative permeability and low aggregate stability. Chemical environment may range from acidic moorland soils to saline marshes. There are significant trends to lower aggregate stability and coarser grain size. Many pipes in the areas studied appear to be dormant or relatively inactive and may well be in approximate equilibrium with the soil pore and channel subsystems. However, when equilibrium is destroyed (for example, by stream incision) pipes can form loci for channel extension. Studies of the spatial distribution of outlets show that to create normal channel networks, pipe clusters within the ensemble and, similarly, individual pipes within those clusters must be selected on an unequal basis. A low density random selection from pipes located on soil water flowlines would fulfill the requirements. The presence of piping may have a significant effect on the form of the hydrograph. DATA ON THE GRANULOMETRY OF THE SURFICIAL SEDIMENT LAYER OF THE RAZELM-SINOE LAGOONAL COMPLEX (French: Donnees sur la granulometrie de la couche superficielle de sediments du complexe lagunaire Razelm-Sinoe),
Institute of Hydrotechnical Research, Bucharest (Rumania).
I. State, and I. Decu.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 158-164, 1970. 7 p, 2 fig, 1 tab, 4 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Sampling, *Deltas, *Lakes, *Sedimentation, *Sediment load, Aggradation, Silting, Sedimentary structures, Stratigraphy, Alluvium, Alluvial channels.
Identifiers: *Danube delta.

The lagoon complex Razelm-Sinoe by its origin and evolution is considered to belong to the Danube Delta, which is subject to intensive aggradation. Data were collected for a better understanding of the granulometry distribution of the deposits on the bottom of the main lake-basins of the complex (Razelm, Golovita, Sinoe). Deposits on the bottom of these lakes have both a mineral and biological origin. The main part is conveyed from the Danube river through the connecting channels and canals Dranov, Mustaca, Dunaval, and Fundea. The Dranov and Dunaval canals carry yearly into Razelm lake approximately 192.006 cu m of suspended load. Data obtained were used to draw up five cross profiles showing the percentage distribution of characteristic diameters and a map showing the plane distribution of the median diameter. (Knapp-USGS)
W71-09829

CHARACTERISTICS OF THE WATER FLOW INSIDE THE DANUBE DELTA,
Institute of Hydrotechnical Research, Bucharest (Rumania).
Constantin Diaconu, and Viorel Al. Stanescu.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 220-238, 1970. 19 p, 10 fig, 1 tab. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Streamflow, *Water storage, Runoff, Topography, Geomorphology, Lakes, Water levels, Water level fluctuations, Stage-discharge relations.
Identifiers: *Danube delta.

The hydrologic regime of the Danube Delta has some characteristics which have led to an original hydrogeologic method of investigation. Because of their close inter-relation, the morphological aspects have to be considered as parts of the same organic whole. Morphohydrographic elements can be divided into two distinct categories: (1) positive elements (soils of predeltaic origin, river and maritime ridges) and (2) negative elements (the hydrographical network and the depressions inside the delta). The depressions inside the delta play an importatnt part as an accumulation basin in the water circulation system between the arms and the interior of the delta. The principal water courses are: the main arms, the connecting channels between the arms and the inside of the delta, the connecting channels between the arms and the outside of the delta, and the connecting channels between the inside zones and the sea. These discharges on their way to the sea are modified by water storage inside the delta, by the rate of increase of the water levels and by the duration of high waters. This result was plotted as a diagram showing the differences between the discharges at the branching point and at the mouth of the arms, and the discharges at the apex of the delta. (Knapp-USGS)

REMARKS ON THE REGIONAL GEOLOGICAL STRUCTURE OF THE NILE DELTA,
Egyptian Desert Inst., Cairo.
A. Shata, and I. El Fayoumy.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 189-197, 1970. 9 p, 13 fig, 9 ref (Also published in IASH Publication No 90, 1970).

Descriptors: *Structural geology, *Geologic control, *Geology, *Deltas, *Faults (Geology), Subsidence, Sedimentation, Geomorphology, Hydrogeology, Structure.
Identifiers: *Nile Delta.

The regional geological structure of the Nile Delta is a portion of a major downwarp zone characterizing the unstable shelf region of Northern UAR. This downwarp zone is affected by faulting, particularly in the southern porition. Within that portion two sets of faults are suspected; the NW set of

faults which account for the local development of a graben-like structure and the NE set of faults. Towards the northern edge of this downwarp zone, thrust faulting with a NE strike is expected. (K-napp-USGS)

THE NATURAL EQUILIBRIUM OF DELTAS (French: L'equilibre naturel des deltas),
Academia R.P.R., Bucharest. Hydrologic Commission.
A. C. Banu.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 184-188, 1970. 5 p, 7 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Water chemistry, Equilibrium, Climates, Geology, Geomorphology, Hydrogeology, Reviews, Environment, Alluvial channels, Channel morphology.
Identifiers: Delta growth.

The natural equilibrium of deltas is extremely unstable. It involves quantitative and qualitative relationship of stable proportion between climatic, geological and geomorphological, hydrological, chemical and biological processes. This equilibrium is maintained as long as the dynamic processes occurring in the deltaic environment are not modified as to their direction, intensity and frequency. The importance of the causal influence among these factors increases from the physico-chemical processes towards the biological ones. In its turn, the biologic factor influences the physico-chemical factors; however, the importance of this influence and of its effect on the content of the biotope varies with the evolution of the delta. A marked and rapid reversal of equilibrium takes place when man's intervention in the exploitation of deltas is made in opposition to the normal processes of evolution. (Knapp-USGS)

MORPHOLOGICAL AND HYDROLOGICAL CHARACTERISTICS OF LAKES OF THE DANUBE DELTA (French: Les caracteristiques morphologiques et hydrologiques des lacs du delta du Danube),
Institutal Geologic, Bucharest (Rumania).
Petre Gastescu.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 172-181, 1970. 10 p, 3 fig, 1 tab, 5 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Geomorphology, *Water balance, *Lakes, Sedimentation, Hydrology, Reviews, Hydrogeology, Surveys, Streamflow, Sediment load.
Identifiers: *Danube delta.

A short general description is given of the Danube delta as a morphological and physiographical unit. The Danube delta may be divided in two parts: fluvio-lacustrine, and lagoonal (marine). The morphobathymetrical characteristics and the hydrographical relations of the lakes with the main arms of the Danube are related to major features in the hydrologic regime, especially the hydrologic budget. The values of the water balance terms reflect the geographical zonality of precipitation and evaporation and the azonality of runoff. (K-napp-USGS)

HYDROLOGICAL PROCESSES IN OFFINGS AND THEIR ROLE IN FORMATION OF A DELTA FRONT,
State Oceanographic Inst., Moscow (USSR).
N. A. Skriptunov.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 164-172, 1970. 9 p, 6 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Geomorphology, Waves (Water), Hydrology, Sedimentary structures, Deposition (Sediments), Bed load, Suspended load, Stratigraphy, Tides, Topography, Sands.

The boundaries of the seaward parts of river mouths, zonation, classification, the factors determining type and the main factors determining the regime are considered together with river-mouth hydrological processes (water level, currents, turbidity, salinity, ice conditions, waves, etc.). The influences of hydrological conditions on the hydrological and morphological characteristics of delta branches are discussed. Changes in hydrological conditions under the influence of man-made structures are also considered. The delta front, as a result of interaction between river and sea, is the most dynamic type of shore. The factors determining the formation of the type of delta front are given, in particular for development of delta fronts with, prevalence of sea factors or with prevalence of river factors. The seasonal prevalences of river and sea factors, is the reason of the cyclic evolution of delta fronts. The role of man's activity in changing of delta fronts and delta bars is considered and the possibility of the forecasting of the type of delta front with an artificial mouth is discussed. (Knapp-USGS)
W71-09835

HYDROLOGIC-MORPHOMETRIC CHARACTERISTICS OF DELTA BRANCHES,
State Oceanographic Inst., Moscow (USSR).
V. N. Mikhailov.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 146-158, 1970. 13 p, 5 fig, 3 tab, 6 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Sediment transport, *Sedimentary structures, Hydraulics, Geomorphology, Channel morphology, Bed load, Sediment load, Equations.

The main hydrologic-morphometrical characteristics of delta branches are: water discharge; water level; mean elevation of bottom; water surface slope; mean flow velocity; cross-section area; channel width; mean depth; sediment discharge; mean sediment concentration; mean diameter of bottom sediments; Manning's coefficient of roughness. All hydrologic-morphometric characteristics of branches change both in time and in space. The main factors determining their variability are hydrological conditions at upper and lower boundaries of deltas (water discharge and sea level), channel processes in branches (erosion and accretion of bed), specific river mouth processes, interaction between sea and river waters, development of deltas, and local hydraulic conditions. Methods are given for estimation of hydrologic-morphometric characteristics of delta branches by hydrometric, hydraulic and hydrologic-morphometric equations. (Knapp-USGS)

HYDRAULIC THEORY FOR THE BOTTOM STREAM MOVEMENT OF THE RIVER BED SEDIMENT ON THE LANDWARD SIDE OF THE SHELF EDGE IN ESTUARIES,
Zakavkazskii Naucho-Issledovatelskii Gidrometeorologicheskii Institut, Tiflis (USSR).
T. G. Vojnich-Sjanojensky, L. D. Gogeliany, and B. I. Kalandadze.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 128-137, 1970. 10 p, 8 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sediment transport, *Bed load, *Suspended load, *Turbidity currents, Turbulent flow, Waves (Water), Mud, Sedimentation, Dispersion, Mixing, Scour, Erosion.
Identifiers: Boussinesq equation.

A one-dimensional theory of movement is given for river flow with high sediment concentration over a river-bar and great drop in depth at the bottom of submerged canyons near the river mouth. One-dimensional hydraulic equations are deduced from the general dynamic equations for turbulent flow of liquids containing suspended solids. They are derived from equations of Saint-Venant-Boussinesq. An approximation of the friction mechanism is obtained by combining semi-empirical theories, taking in account the influence of the solids component on the intensity of turbulence and additional account of Coulomb friction on the dispersoid contact with the surface of the shelf edge. Using equations of dynamics and mass balance, the conditions of wave movement for the basal stream of a flow with high concentrations of sediment on a steep shelf edge are analyzed and modifications are derived for calculating velocities of dense streams with muddy characteristics on the bottoms of submerged canyons near the estuary. (Knapp-USGS)
W71-09837

FORMATION OF MODERN DELTA BRANCHES ON NON-TIDAL RIVERS WITH LARGE SEDIMENT DISCHARGE,
State Oceanographic Inst., Moscow (USSR).
S. S. Baydin.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 113-120, 1970. 8 p, 5 fig, 7 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Sediment load, Bed load, Deposition (Sediments), Geomorphology, Sediment discharge, Alluvial channels.

Formation of the distributary networks of non-tidal deltas with large sediment discharge is connected with breaking of natural levee. The complete cycle includes four stages: the lacustrine stage, the many-branched stage (within the delta), the single-branched stage, and the many-branched stage (seaward of the delta front). The duration of each stage depends on the amount of sediment transport, on the possibility of sedimentation in a flood plain or on the possibility of sedimentation at the place where the river flows into the sea. The variability of channel processes, the profile of the water surface and the water discharge distribution between the branches, the influence of man-made levees, and of base level change on the processes and the duration of the cycle and its stages are discussed. (Knapp-USGS)

SOME PROBLEMS OF MOVEMENT OF SOLID MATERIALS AND OF EROSION IN ESTUARIES AND DELTAS (French: Quelques problemes du mouvement des materiaux solides et de l'erosion dans les estuaires et les deltas),
Ghent Rijksuniversiteit (Belgium).
L. J. Tison, and G. Tison.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 101-112, 1970. 12 p, 9 fig, 6 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Sedimentation, *Tidal effects, *Estuaries, *Deltas, *Channel improvement, Currents (Water), Velocity, Silting, Bed load, Scour, Erosion, Waves (Water).
Identifiers: Channel changes.

Improvement of the lower part of a river can be the cause of important changes in the morphology of the estuary or the delta by facilitating of tidal

waves. This easier penetration causes both an increase in the flood volume and a reduction in time of the flood. The resulting growth in the velocity of the flood is not accompanied by a corresponding increase in the rapidity of the ebb, with the consequence that the solid materials have a marked tendency to be returned towards the upstream part of the delta region, where sedimentation increases. Local changes, even though in themselves insignificant, considerably change sharing of the flows between various arms, causing marked changes in the movement of materials, which could even lead to choking some arms. (Knapp-USGS)
W71-09839

ANCIENT DELTAS ON ROMANIAN TERRITORY (French: Deltas anciens sur le territoire de la Roumanie),
Pedagogical Inst., Suceava (Rumania); and Research Inst. for Land Reclamation and Soil, Bucharest (Rumania).
N. Popp, and D. Teaci.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 89-100, 1970. 12 p, 2 fig, 7 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Paleohydrology, Sedimentary structures, Lakes, Soil formation, Stratigraphy, Geomorphology, Climates.
Identifiers: *Romania.

In the extra-carpathian plains, especially in the Western Plain of Romania, are scattered a series of old deltaic plains, developed after the general drainage of the Panonic lake and of other lakes. The history of these deltas under different geomorphological, hydrogeological and climatic conditions, can be used to study evolution of the Danube Delta. For each of the old deltas (Somes, Crisuri, Mures, Timis-Bega, Dimbovita, Prahova, Siret) the present situation is characterized to explain chronologically their evolution and all the effects this evolution had on the development of the landscape as a whole, and on soil formation. GEOPHYSICAL CONTRIBUTIONS TO THE STUDY OF THE GEOLOGIC EVOLUTION AND MORPHOGENESIS OF THE DANUBE DELTA (French: Contributions geophysiques a la connaissance de l'evolution geologique et de la morphogenese du Delta du Danube),
Institutul de Geogizica Applica, Bucharest (Rumania); and State Commission for Geology, Bucharest (Rumania).
Stefan Airinei, and Artemiu Pricajan.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 64-74, 1970. 11 p, 3 fig, 18 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Sedimentation, *Deltas, *Stratigraphy, *Topography, *Sedimentary structures, Geology, Geophysics, Geomorphology, Geologic control, Subsidence.
Identifiers: *Danube delta.

A correlation of the geophysical and geological data in the Danube delta shows (a) the structure of the deep basement, which is dislocated in steps, horsts, and grabens; (b) the structure of the immediate predeltaic basement; (c) the structural and erosional immediate basement invaded by the first paleo-euxinic transgression; (d) the trends of redistribution and sedimentation of the deltaic material. The W-E orientation is predominant in the structures of the deep basement, and in structures subordinate to the immediate basement, as well as in predeltaic morphological forms of the peninsular and insular system. The microrelief of the Delta inner ridges and littoral belts are approximately NE-SW. They were formed by redistribution and sedimentation of deltaic material under preponderent influences of maritime and eolian currents. (Knapp-USGS)

DELTAS OF THE ZONES CHARACTERIZED BY SINKING OF THE EARTH'S CRUST,
Akademiya Nauk SSSR, Moscow. Pochvennyi Institut.
V. V. Egorov.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 38-43, 1970. 6 p, 4 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Sedimentation, *Subsidence, Deposition (Sediments), Stratigraphy, Geomorphology, Alluvium, Alluvial channels, Coasts, Estuaries, Sea level, Bed load, Sediments.
Identifiers: *USSR.

The formation of deltas under conditions of crustal of sinking on the coasts of tideless water bodies is discussed. The Aralo-Caspian and Black Sea Coast deltas of the Kura, Terek, Kuban and Prut rivers as well as the paleodelta of the Volga can serve as an example of this type of delta. If the rate of sinking exceeds that of alluvium accumulation which is accompanied by delta withdrawal and intrusion of sea waters into a river valley, an estuary is formed. Under a slower process of delta sinking, the rate of alluvium accumulation exceeds that of sinking and a delta is formed. The formation of series of deposits and relief forms, the state of groundwater and the processes of modern salt accumulation in the deltaic regions are considered in relation to these two situations. (Knapp-USGS)

HYDROLOGY OF DELTA DEPOSITS IN GLACIATED VALLEYS IN NEW YORK,
Geological Survey, Orlando, Fla. Water Resources Div.
Leslie J. Crain.
In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 29-37, 1970. 9 p, 9 fig, 5 ref. (Also published in IASH Publication No 90, 1970).

Descriptors: *Deltas, *Aquifers, *Glacial drift, *New York, Sands, Clays, Lakes, Aquifer characteristics, Water storage, Water yield, Pleistocene epoch, Stratigraphy, Water resources development.
Identifiers: Jamestown (NY), Finger Lakes (NY).

Glaciated valleys in southwestern New York State contain thin layers of glaciofluvial sand and gravel interbedded in thick sequences of lacustrine material. These sand and gravel layers are important aquifers. The valleys also contain buried deltaic deposits adjacent to the valley walls. Streams that drained the uplands formed deltas in the pro- and post-glacial lakes in the valleys. Most of the delta deposits are in hydraulic contact with the glacial aquifers at depth; the deltas provide areas for recharge and reservoirs for storage of water. Wells that tap the glacial aquifers drain the stored water during summer and the water is replenished by precipitation and stream infiltration during winter and spring. Because of the relation of the delta deposits to the glacial aquifers the deltas have great potential for increasing groundwater yields through the manipulation of their water levels by pumping the glacial aquifers and by acting as temporary reservoirs to store excess streamflow during floods. Results of these studies apply to other regions in the western part of the state as they may to many other glaciated areas. (Knapp-USGS)

A LABORATORY STUDY OF THE SOLUBLE METALS IN ROCK FROM THE BROAD QUADRANGLE, GEORGIA,
Georgia Inst. of Tech., Atlanta. Water Resources Center.
Charles A. Salotti.
Available from the National Technical Information Service as PB-200 656, $3.00 in paper copy, $0.95 in microfiche. Water Resources Center, Georgia Institute of Technology, Atlanta, June 1971, 11 p. OWRR Project A-021-GA (1).

Descriptors: *Soluble metals, *Granites, *Aqueous solutions, *Absorption, Magnesium, Calcium, Groundwater, Solubility, Georgia, *Solubility, Solutes, Analytical techniques, Spectrophotometry.
Identifiers: *Broad Quadrangle (Georgia), *Saprolite, Danburg granite.

The purpose of the study was to determine the solubilities of specific metals under controlled conditions from mineralogically and chemically studied rocks from the Broad Quadrangle, Georgia. Distilled deionized water was circulated in a non-contaminating system through crushed granite at controlled rates and temperature for a period of several months. The solubilities of calcium and magnesium were measured in the laboratory and compared with concentrations measured in the field. These comparisons showed that the natural concentrations of calcium and magnesium are much higher than those measured in the laboratory. The absence of dissolved carbon dioxide in the laboratory water was though to account partly for the low experimental concentrations, but not the large difference found. Colloidal and/or organo-metallic transport possible accounts for part of the discrepancy . (Conway-Georgia Tech)

EFFECT OF Mg (2..) ION ON THE SOLUBILITY OF SOLID CARBONATES,
Utah State Univ., Logan. Dept. of Soils and Meteorology.
. J. Hassett, and J. J. Jurinak.
Soil Science Society of America Proceedings, Vol 5, No 3, p 403-406, May-Jun 1971. 4 p, 5 fig, 1 ab, 15 ref.

Descriptors: *Carbonates, *Magnesium, *Dolomite, *Irrigation water, *Solubility, Aqueous olutions, Solutes, Leaching, Mineralogy, Chemical precipitation, Calcite, Water chemistry, Water quality, Salinity, Chemical potential.
dentifiers: Common ion effect, Sodium hazard.

The carbonate saturometer was used to determine he effect of Mg ion on the solubility of four different calcareous materials. It was found that a high rea calcite (about 13.5 sq m/g) had a higher solubility than a low area calcite (about .8 sq m/g) and hat the difference in surface areas of these calcites nodified the effect of Mg ion on their solubilities. The mineralogy of the solid carbonates can modify he effect of Mg ion on the solubility of the solid hase. Carbonates which contained appreciable Mg showed a decrease in solubility with increasing Mg ion, whereas carbonates with low or no Mg howed an increase in solubility. (Knapp-USGS)

Descriptors: *Soil chemistry, *Cobalt, *Aqueous olutions, Sudangrass, Tracers, Ion exchange, Absorption, Clay minerals, Chemical potential.

Large increases in the uptake of Co, Zn, and Mn by udangrass were observed when FeCl2, AlCl3, and aCl2 were added to the soil in which the plants ere grown. The isotopically exchangeable cobalt the soil remained unchanged regardless of the oil pH or the addition of Fe, Al or Ca to the soil. ncreases in the cobalt content of sudangrass result from changes in the soil solution concentration of cobalt in the soil rather than the quantity of cobalt. The effect of Fe, Al, and Ca additions and soil pH in producing the changes in cobalt content of sudangrass was caused by soil factors rather than changes in plant response. One-hundredth normal HCl is a useful extracting agent for determining the quantity of cobalt in the soil, and 0.1M CaCl2 gives the best indication of the potential soil solution concentration of cobalt in the soil. The choice of kaolinite sample for surface chemical studies is examined. An adsorption apparatus, particularly suited for those studies where the adsorbate acts as a deflocculant, is described. Some preliminary results are given for the adsorption of total phosphate from tetrasodium pyrophosphate solutions and of polyacrylate from sodium polyacrylate solutions. The release of aluminum and silicon from the kaolinite was measured; with tetrasodium pyrophosphate, aluminum-phosphate complexes are formed. Competitive adsorption measurements suggest that the polyacrylate is adsorbed on the positively charged edges of the kaolinite. (Knapp-USGS)

TRANSFORMATION OF RIVER WATERS TO SEA WATERS AT RIVER MOUTHS,
State Oceanographic Inst., Moscow (USSR).
A. I. Simonov.

In: Hydrology of Deltas, Vol 1, Proceedings of the Bucharest Symposium, May 6-14, 1969: International Association of Scientific Hydrology-Unesco Co-edition, p 182-184, 1970. 3 p. (Also published in IASH Publication No 90, 1970).

Descriptors: *Water chemistry, *Mixing, *Deltas, Salinity, Turbidity, Sedimentation, Chemical precipitation, Water temperature, Reviews, Discharge (Water), Water circulation, Currents (Water), Density, Waves (Water), Estuaries.

The results of dynamic and chemical interaction between river and sea waters at the mouth (energy, suspended solids content, heat discharge, slight mineralization and salt balance) are discussed. River discharge is the leading factor of water mixing. Chemical exchange accompanies dynamic mixing. The laws of change of flow velocity, salinity, turbidity and water temperature during mixing are determined; the general equation of mixing includes a linear component to reflect dynamic mixing conditions and a non-linear component to reflect chemical transformations. The transformation of salt composition typical of river water to that typical of sea water is independent of the salinity of sea water. These laws facilitate investigation and explanation of the hydrological and hydrochemical processes taking place at river mouths. They can also be applied to studies of the dynamics of substances relevant to pollution. (Knapp-USGS)

ESCAROSA: A PRELIMINARY STUDY OF COASTAL ZONE MANAGEMENT PROBLEMS AND OPPORTUNITIES IN ESCAMBIA AND SANTA ROSA COUNTIES, FLORIDA.
Florida Coastal Coordinating Council, Tallahassee.

Florida Coastal Coordinating Council Report, Tallahassee April 1971, 29 p, 7 fig, 3 tab, 98 ref.

Descriptors: *Florida, *Coasts, *Zoning, *Estuaries, *Environmental effects, Soils, Human population, Economics, Land use, Waste disposal, Erosion, Water quality, Dredging, Landfills, Agriculture.
Identifiers: *Escambia County, *Santa Rosa County.

The Coastal Coordinating Council was charged by the 1970 Florida Legislature to develop a plan for the protection, development and zoning of the coasts of Florida. Escarosa (Escambia and Santa Rosa Counties) was selected as a preliminary project as an overview of the principal problems of Coastal Zone management. These problems are typical of most populated coastal areas of Florida. The Northwest Florida Regional Coastal Management Plan will be the first in a series of regional plans which will be developed for the entire Florida Coast. Natural environmental characteristics, socio-economic characteristics, environmental problems and management practices are discussed. (Ensign-PAI)

A COMPREHENSIVE REPORT ON NINETEEN CONDENSATION NUCLEI. PART II,
Atmospheric Sciences Lab, White Sands Missile Range, N.Mex.
Richard D. H. Low.
Available from the National Technical Information Service as AD-721 591, $3.00 in paper copy, $0.95 in microfiche. U.S. Army ECOM Report 5358, Jan 1971. 260 p.

Descriptors: *Artificial precipitation, *Nucleation, *Cloud seeding, *Weather modification, Clouds, Nitrates, Iodides, Sulfates, Fog, Condensation.
Identifiers: Chlorides, Bromides, *Condensation nuclei, Hygroscopicity, Cloud physics.

This is Part II of 'A Comprehensive Report on Nineteen Condensation Nuclei,' which contains tabulations of the growth times of these nuclei under various assumed supersaturations. The growth time of each nucleus at a given super saturation is obtained from a newly developed growth rate equation which utilizes a single parameter to denote the hygroscopicity of the nucleus and which includes an additional term to reflect the inefficiency of the condensation process. This volume and its predecessor serve as a valuable reference for the experimental cloud physicist in his study of the growth behaviors of condensation nuclei and for the field cloud physicist in his selection of the proper artificial nuclei for warm fog or cloud modification.
W71-09576

PREDICTING WELL YIELDS - TWO CASE HISTORIES,
Patchick Consulting Hydrogeologist, White Bear Lake, Minn.
P. F. Patchick.
Groundwater Vol 5, No 2, p 41-53, April 1967, 6 tab, 6 fig, 3 photo, 26 ref.

Descriptors: *Water wells, *Groundwater, Aquifer characteristics, Logging (Recording), Specific capacity, Screens.
Identifiers: *Permeability estimates (Wells), Drill cutting.

Two case histories are presented which illustrate that by analyzing drill cuttings or bailed samples, by knowing total depth of a test hole and position of the static water level, and by studying the driller's log, not only can a well's yield be predicted - but also drawdown may be predicted for any well in advance of a pumping test. The estimation of specific capacity (gpm/ft of drawdown) is invaluable in well design, particularly in the United States, where drilling contractors work rapidly and efficiently. Knowledge of probable specific capacity can aid in recommending proper screen length, diameter, slot width, and setting. It will enable cost estimates for proper pump size to be made, for casing requirements to be determined, and also for ultimate well diameter and depth to be determined. Test-pump setting can also be anticipated. Six figures are included showing well construction details, sieve analysis curves, a semi-log plot of recovery measurements obtained during an aquifer pumping test, and graphic representations of approximate permeabilities for granular materials ranging from clay/silt to fine gravel. Six tables give characteristics of samples recovered from two test wells permeability estimates of the disturbed samples approximate permeabilities of various granular materials, and specific capacities for 100 percent effective water wells with varying diameters, coefficients of storage, and pumping periods. Three photographs further illustrate the principles enumerated. The methods described can give acceptable results (although they may not be as spectacular as the two detailed case histories) if sound judgment is used; if local conditions are somewhat known; if sampling methods are described; and if the procedures are not abused by expecting extreme accuracy. A reasonable estimate, or perhaps 'guesstimate' is all that should be hoped for by the hydrogeologist. (Campbell-NWWA)

SUPPLEMENTAL IRRIGATION WITH STREAM WATER CONTAMINATED BY ACID MINE DRAINAGE,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
Richard W. Terkeltoub.
Water Resources Research, Vol 7, No 3, p 704-708, June 1971. 5 p, 2 fig, 1 tab, 3 ref.

Descriptors: *Acid mine water, *Irrigation water, *Pennsylvania, Water pollution control, Iron, Hydrogen ion concentration, Water utilization, Flooding, Water chemistry, Soil-water-plant relationships, Water quality, Sampling, Impaired water quality.

Many streams in the Appalachian coal producing region, which could furnish supplemental irrigation water, are polluted with acid mine drainage. They consequently contain much greater trace concentrations and have lower pH than do nearby streams that carry only agricultural drainage. Nevertheless, supplemental irrigation of barley plants grown in a greenhouse with acid mine water was as beneficial to plant growth as supplemental irrigation with deionized water. The capacity of the soil to buffer pH and adsorb trace metals apparently counteracts the properties of acid mine water, which are detrimental to plant growth. Furthermore, the agricultural quality of a field often flooded with acid mine water has been maintained by adding lime to offset the reduced pH. Thus under certain soil conditions and management practices, acid mine water can be used for supplemental irrigation. (Knapp-USGS)

PUBLIC WATER SUPPLY SYSTEMS.
American Water Works Association, New York.

In: Public Facility Needs, Washington, US Government Printing Office, 1966, p 105-124.

Descriptors: *Water supply, *Public utility, *Investment, *Capital costs, Water treatment, Water distribution, Population, Financing, Government supports.
Identifiers: *Plant facilities, Performance standards, Water utility cost indexes, Operations, Maintenance.

This article presents a comprehensive survey of the public water supply utility industry. The nature and composition of the industry is broken down into a description of the physical characteristics, the services rendered, the standards of performance, and the existing capital plant. The costs and user charges are then dealth with, particular attention being given to construction costs, incremental costs of water facilities, typical water utility cost indexes, plant investment, and annual expense of operations and maintenance. The water utility financing and user charges incorporates explanations of both self-supporting enterprises and tax-supported enterprises. Trends in capital outlays are indicated, and projections are made for water industry needs and prospective capital outlays, in terms of population growth, depreciation, deficiencies, water rates, private investment capital, and federal assistance programs in the future. (Murphy-Rutgers)

3E. Conservation in Industry

WATER IN THE CHEMICAL INDUSTRY,
D. F. Othmer.
Chemical and Process Engineering, p 142-144, Vol 5, No 6, June 1970.

Descriptors: *Water supply, *Water reuse, *Economics, Cost comparisons, *Desalination, Columbia River, Mississippi River.
Identifiers: Controlled flash evaporation system, Rhine River, Egypt.

This article reviews the options available for increasing the supply of water especially for industrial uses. The author specifically describes the importance and economics of desalination and predicts that 'possibly by 1975' desalinated water may be available to large seacoast cities at a cost as low as $0.35 - 0.40/1,000 gallons. He maintains that dual water systems although 'prohibitively expensive for existing cities' should be considered for new urban construction. He discusses the various primary, secondary and tertiary treatments of waste waters and encourages water reuse in the chemical industries. (Holmes-Rutgers)

CENTRIFUGAL PUMPS - ECONOMIC IMPLICATIONS OF SELECTION,
Gujarat Cooperative Executive Development Centre, Ahmedabad (India).
S. M. Patel.
Indian Farming, Vol 20, No 9, p 39-41, Dec 1970. 51, 1 table.

Descriptors: *Irrigation practices, Irrigation efficiency, Cost comparisons, Economics.
Identifiers: *India, Ramlal, Fourth Five - Year Plan.

Indian farmers and therefore the agriculture of the country could benefit by careful selection of proper mechanized lift irrigation equipment. Indian farmers do not consider when purchasing centrifugal pumps whether the pump is well made or whether the pump matches the well on which it is to be installed. Pump manufacturers should hire technically trained salesmen to assist the farmer in his purchase. (Holmes-Rutgers)

GROWING CORN IN GROWTH CHAMBERS WITH DIFFERENT MANURE TREATMENTS,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
Eugene Goering, R. I. Lipper, and H. L. Manges.
Unpublished Paper, Presented 1971 Mid-Central Meeting American Society of Agricultural Engineers, Paper No MC-71-104, 17 p, 10 tab, 6 ref.

Descriptors: *Farm wastes, *Crop response, Disposal, Laboratory tests, Plant tissues, Growth chambers, Cattle.
Identifiers: Manure, Application rates, Contamination.

The purpose of this experiment was to determine the effect on corn germination and early growth of different manure loading rates and to compare the effect of planting in manure mixed with soil against placement of seed above a manure layer. Germination and early growth of corn in plant growth chambers were adversely affected by applications of beef feedlot manure at rates ranging from 35 to 175 tons/acre, oven dry basis. The effects were dif-

ferent when manure was completely mixed with soil than when applied as a layer under a soil cover. (Christenbury-Iowa State)

POLITICAL AND SOCIAL BARRIERS TO WESTERN WATER DEVELOPMENT,
Idaho Univ., Moscow.
William E. Folz.
Strategies for Western Regional Water Development, Proceedings of the Western Interstate Water Conference, Corvallis, Oregon, p 72-95, 1965. 24 references.

Descriptors: *Water supply, Economics, Political aspects, Pricing, Market value.
Identifiers: *Kenneth Boulding - California Water Plan, Interagency Committee Report, TVA, Pacific Southwest Water Plan, Senate Bill 1275, U.S. Bureau of Reclamation.

If political and social barriers were to be controlled Western Water Resources would be developed satisfactorily. It would assume that market determination of water utilization would be the use to which the water could be applied. For the most part, the economic studies in the past ten years support this thesis. When we accept this form of criteria, we lose the political compromise and expendiency. People must be willing to pay collectively for the adequate supply of water. The models should be based on a certain market value. (William Campbell-Rutgers)

TRANSIENT SEEPAGE FLOW TOWARD TWO PARALLEL DRAINS,
Wisconsin Univ., Madison. Dept. of Mechanics; and Wisconsin Univ., Madison. Dept. of Physics; and Wisconsin Univ., Madison. Water Resources Center.
Imre Gyuk, and Gabor M. Karadi.
(1971), 16 p, 7 fig, 2 ref. OWRR Project A-029-WIS (1).

Descriptors: *Tiles, *Tile drainage, *Free surfaces, *Seepage, *Flow.
Identifiers: *Conformal mapping, *Transient seepage, *Computation, Partial differential equations.

The method of conformal mapping is applied to the analysis of transient seepage flow toward two parallel drains in a semi-infinite aquifer taking into consideration the non-linear boundary condition on the free surface. The mapping function is expressed as the power function of time and the seepage domain is mapped onto a domain of an auxiliary complex variable in such a manner that the free surface will always remain the real axis. The solution is first obtained to a single drain by neglecting the terms of the fourth on higher order. Then the solution is extended to two parallel drains by using the method of images. Calculations are carried out for different ratios of drain depth to drain spacing using various drain diameter to drain depth ratios.

FLOOD PLAIN INFORMATION, LENOIR, NORTH CAROLINA, LOWER CREEK, BLAIR FORK, LONG BRANCH, ZACKS FORK CREEK AND ZACKS FORK BRANCH.
Corps of Engineers, Charleston, S.C.

Army Corps of Engineers Flood Plain Report, May 1970. 72 p, 29 fig, 20 plate, 13 tab.

Descriptors: *Floods, *Flood damage, *North Carolina, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: *Lenoir (NC), Standard Project Flood, Intermediate Regional Flood.

Flooding of Lenoir, North Carolina is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. The 1940 Flood is estimated to have crested throughout the study area at stages approximately equivalent to those that would be reached by Intermediate Regional Flood. Major floods have occurred with about the same frequency on Blair Fork, Long Branch, and Lower Creek. (Woodard-USGS)
W71-09600

FLOOD PLAIN INFORMATION, TINKERS CREEK, TWINSBURG, SUMMIT COUNTY, OHIO.
Corps of Engineers, Buffalo, N.Y.

Army Corps of Engineers Flood Plain Report, April 1970. 57 p, 44 fig, 10 plate, 9 tab.

Descriptors: *Floods, *Flood plains, *Flood damage, *Ohio, Regional flood, Historic flood, Flood forecasting, Design flood, Flood control.
Identifiers: *Tinkers Creek (Summit County-Ohio), Standard Project Flood, Intermediate Regional Flood.

Flooding along Tinkers Creek in Summit County, Ohio is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The stage of 10.1 feet recorded at Bedford July 20, 1969 was the maximum stage of record since the gage was installed in 1962. The storm was centered approximately 3 miles southwest of the Bedford gage. Of the 5.60 inches of rain that fell in this area during a 24-hour period, the majority was recorded between 11:15 a.m. and 1:15 p.m. Since the stream slopes of the main stem and tributaries are fairly steep in this region, the majority of this precipitation was rapidly transported to the Bedford gage, peaking at 4:30 p.m. (Woodard-USGS)

MANAGEMENT OF WATER QUALITY IN RELEASES FROM SOUTHWESTERN IMPOUNDMENTS,
Texas Univ., Austin. Environmental Health Engineering Program.
Herman M. Clay, Jr., and E. Gus Fruh.
(1971), 22 p, 7 fig, 2 tab, 20 ref. OWRR Project B-040-TEX (2).

Descriptors: Stratification, *Withdrawal, *Impoundments, Water quality, Reservoirs, Water utilization, *Water management (Applied), Discharge (Water), Model studies.
Identifiers: *Selective withdrawal, Southwestern US, Bohan-Grace solution.

The objective was to determine the selectivity of withdrawal which is possible in southwestern reservoirs. Two stratified flow solutions were examined to test their applicability under field conditions. Although both appeared capable of accurate prediction of the outflow velocity profile, the Bohan-Grace solution, which required less input data, was utilized to predict the chemical constituents of single and simultaneous releases from several southwestern impoundments. Prediction of outflow water quality was within fifteen percent for southwestern reservoirs as shallow as fifty-five feet. The withdrawal layer thickness for the subject Texas impoundments included the entire hypolimnion or epilmnion depending on outlet location. The sensitivity of the velocity profile to seasonal changes, reservoir discharge rate and withdrawal port dimensions also is illustrated. (See also W71-06193 and W71-09743)

W71-09742

SELECTIVE WITHDRAWAL AS A WATER QUALITY MANAGEMENT TOOL FOR SOUTHWESTERN IMPOUNDMENTS,
Texas Univ., Austin. Environmental Health Engineering Program.
E. Gus Fruh, and Herman M. Clay, Jr.
(1971), 22 p, 8 fig, 2 tab, 13 ref. OWRR Project B-040-TEX (3).

Descriptors: Stratification, *Withdrawal, *Impoundments, Water quality, Reservoir, Water utilization, *Water management (Applied), Discharge (Water), Model studies.
Identifiers: *Selective withdrawal, Southwestern US, Bohan-Grace solution.

The objective was the development of a preliminary simulation model of impoundment water quality that included an accurate description of stratified flow and selective withdrawal. Two stratified flow solutions were examined to test their applicability to describe reservoir withdrawal hydraulics under field conditions. Although both appeared capable of accurate prediction of the outflow velocity profile, the Bohan-Grace solution, which required less input data, was selected allowing application to impoundments for which field data are minimum. The simulation model, including the Bohan-Grace solution for reservoir withdrawal hydraulics, was assessed for a two-year period for which sufficient field data were available. The error in penstock temperature prediction ranged from 0 to 5F. (See also W71-06193 and W71-09742)
W71-09743

FLOOD PLAIN INFORMATION, MORGANTON, NORTH CAROLINA - VOLUME 2. CATAWBA RIVER, SILVER CREEK AND BAILEY FORK.
Corps of Engineers, Charleston, S.C.

Army Corps of Engineers Flood Plain Report, January 1970. 54 p, 9 fig, 16 plate, 14 tab.

Descriptors: *Floods, *Flood damage, *North Carolina, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: *Morganton (North Carolina), Standard Project Flood, Intermediate Regional Flood.

Flooding of Catawba River, Morganton, North Carolina is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occured and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. The largest known flood recorded on the Catawba River in the Morganton area occurred in July 1916. The river rose at Morganton to about 41 feet above normal at the foot of Green Street, 17 feet above the highest water ever before recorded there. (Woodard-USGS)
W71-09845

FLOOD PLAIN INFORMATION, ALBUQUERQUE ARROYOS, PART 1, ALBUQUERQUE, NEW MEXICO.
Corps of Engineers, Albuquerque, N. Mex.

Army Corps of Engineers Flood Plain Report, June 1970. 34 p, 5 fig, 11 plate, 1 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Urbanization, *New Mexico, Regional flood, Flood forecasting, Flood control.
Identifiers: *Albuquerque (N Mex), Standard Project Flood, Intermediate Regional Flood.

Flooding along the numerous Arroyo Channels in or adjacent to the City of Albuquerque, New Mexico is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections and other material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights, and other technical data. Application of loss rates used in the design of the Albuquerque North Diversion Channel to the critical distribution of 100-year rainfall amounts will produce a total runoff of 1.92 inches over a 6-hour period; rainfall losses would be 0.50 inches for the first hour and 0.16 inches per hour for subsequent periods. For study purposes, all mesa areas were assumed to be developed. (Woodard-USGS)

Geological Survey Open-file Report, USGS-474-87 (AEC), March 1971. 26 p, 7 fig, 3 tab, 2 ref. USAEC Agreement No AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifer characteristics, Water wells, Transmissivity, Specific capacity, On-site tests, Water yield, Water levels, Drawdown, Water supply, Data collections, Sampling, Hydrologic data.
Identifiers: Pumping tests, *Aquifer tests.

The Wagon Wheel Water Well No. 1 was drilled to obtain hydraulic data and to provide a water supply for the deep drilling program at the site of Project Wagon Wheel, which is aimed at determining the feasibility of nuclear stimulation of natural gas reservoirs. The well was tested and water samples were collected by swabbing on August 1, 1969, and by pumping on August 26, 1969. In both tests the 760-meter section through which the well was drilled was tested through 19 gun-perforated intervals. The water level in the well prior to the pumping test was 29.9 meters below land surface. During the pumping test the water level declined to 47.7 meters below land-surface datum while the well was pumped at an average rate of 281 cubic meters per day for 6 hours and 6 minutes. The transmissivity of the aquifer in the vicinity of the well was 26 cubic meters per day per meter and the specific capacity was 16 cubic meters per day per meter of drawdown. (Knapp-USGS)

GROUNDWATER RECONNAISSANCE STUDY OF SELECTED SITES IN ROCKY MOUNTAIN NATIONAL PARK AND SHADOW MOUNTAIN NATIONAL RECREATION AREA,
Geological Survey, Denver, Colo.
Frank A. Welder.
Geological Survey Open-file Report 71001, March 1971. 47 p, 16 fig, 3 tab, 5 ref.

Descriptors: *Water resources development, *National parks, *Colorado, *Water wells, *Water yield, Water supply, Geology, Hydrogeology, Hydrologic data, Data collections.
Identifiers: *Rocky Mountain National Park, *Shadow Mountain Recreation area.

The groundwater supply potential at 30 sites within the Rocky Mountain National Park and Shadow Mountain National Recreation Area was evaluated by the U.S. Geological Survey in 1967 and 1968. The work consisted of a geohydrologic reconnaissance, well inventory, and test drilling. The sites are underlain by Precambrian crystalline rocks, Tertiary sediments, or Quaternary glacial and alluvial deposits. The crystalline rocks are generally poor aquifers; some wells intercepting fractures may yield as much as 10 gallons per minute from wells 100 to 200 feet deep. Wells drilled in Tertiary sandstones to a depth of 50 to 500 feet may supply 1 to 50 gpm. Wells in unconsolidated glacial and alluvial deposits yield the largest supplies of groundwater in the Rocky Mountain National Park. These deposits commonly can supply 5 to 100 gpm to wells. (Knapp-USGS)

Descriptors: *Dowsing, *Water wells, Groundwater, Exploration.
Identifiers: Water witching, Water well location, Magical divination.

For centuries a common figure on the rural horizon has been the man with the charmed forked stick - the water witch, upon whose supposed super natural powers the hopes of many a country farmer have depended. A quaint supersition, some say, but it is a superstition that has persisted and is still widely practiced, despite the advances of science and technology. The authors of this book address themselves to this magical, non-scientific practice that has continued in an age of surmised rationality. Drawing on the authors' extensive backgrounds in anthropology, social psychology, and professional magic, they have studied water witching and water diviners as objectively and sympathetically as possible. They recognize the important role that magic plays in all societies, and they also recognize the very real problems of water shortage that underlie the continued dependence on the divining rod in many parts of the United States, despite the fact that there is no scientific evidence that water witching works. This is a necessity for all groundwater supply workers. (Campbell-NWWA)

COST OF WELLS AND PUMPS,
Illinois State Water Survey, Urbana.
William C. Ackermann.
Groundwater, Vol 7, No 1, p 35-37, January-February 1969, 6 fig.

Descriptors: *Water costs, *Groundwater, Water wells, Water rates.
Identifiers: *Well costs, *Pump costs, Sand and gravel wells, Shallow bedrock wells, Deep sandstone wells, Pumping rates.

The use of this material will give an estimate of the well and pump costs for projects requiring a given capacity. This is intended only as an instrument for establishing orders of magnitude as a basis for comparisons, and of course does not substitute for detailed engineering studies. Well cost data were analyzed for three categories according to the aquifer tapped: sand and gravel, shallow bedrock, and deep sandstone. In the sand and gravel category, tubular and gravel packed wells finished in the glacial materials above bedrock were considered separately. (Campbell-NWWA)
W71-09730

COST OF PUMPING WATER,
Illinois State Water Survey, Urbana.
William C. Ackermann.
Groundwater, Vol 7, No 1, p 38-39, January-February 1969.

Descriptors: *Water costs, *Groundwater, Water wells, Water distribution (Applied), Water rates, Pumps.
Identifiers: *Pumping costs (Wells), Power requirements.

Use of this material will assist in the determination of cost of pumping water, given the quantity of flow required, the total pumping head, the wire-to-water efficiency, and the unit cost of power. A table of conversions is presented to aid in reducing theoretical equations to simplified equations, and a figure is provided for graphical solutions of the equations. (Campbell-NWWA)
W71-09731

LOW RESISTIVITY ON ELECTRIC LOG COULD MEAN 'CHERT',
Schlumberger Well Surveying Corp., Tulsa, Okla.
A. H. Heim, and H. W. True.
World Oil, Vol. 142, No. 4, p. 126, 129-130, March 1956, 7 fig.

Descriptors: *Logging (recording), *Aquifer characteristics, Electric logging, Chert, Ground water, Oil industry.
Identifiers: *Electric log interpretation, Rock drillability.

Low resistivities frequently shown on electrical logs in 'Mississippi chert' sections have been attributed to a combined result of: (1) high porosities, (2) high formation water salinities, (3) possible interbedded shales. Cores from the Mississippian chert zones of some Oklahoma and Kansas wells were analyzed to find the causes for low resistivities frequently shown by such formations on electrical survey logs. All cores were a heterogeneous mixture of microcrystalline quartz material and siliceous shale. The quartzitic material (chert) varied from a dense, flint-like form to a chalky and porous form; porosities up to 40 percent were no uncommon and formation factors were as low as 5. Cores contained no conductive minerals PER SE. (Campbell-NWWA)
W71-09906

CYCLIC PUMPING FOR DRAINAGE PURPOSES,
California Univ., Davis.
G. Aron, V. H. Scott, and M. A. Abu-Zied.
Ground Water, Vol. 5, No. 1, p 35-38, January 1967, 2 tab., 2 fig., 3 ref.

Descriptors: *Water wells, *Pumps, *Aquifer characteristics, Ground water.
Identifiers: *Hydraulics of cyclic pumping, Cyclic pumping design.

Criteria and formulas are presented for scheduling cyclic pumping operations, to maintain a given minimum drawdown as required for drainage purposes. Keeping the total cycle length constant, the pumping periods are successively shortened and the shutoff periods lengthened. Solutions of the equation for the relative length of the shutoff periods are presented in a family of curves, which greatly simplifies the scheduling procedure. (Campbell-NWWA)

APPLICATION AND LIMITATION OF METHODS USED TO ANALYZE PUMPING TEST DATA,
Illinois State Water Survey, Urbana.
William C. Walton.
Water Well Journal, Vol 15, Nos. 2 and 3, Part 1, p. 22, 49, 50, 53, 56; Part 2, p. 20, 46, 48, 50, 52, February and March 1960, 2 tab., 5 fig., 13 ref.

Descriptors: *Water wells, *Aquifer characteristics, *Ground water, Theis formula, Jacob and Cooper formula, Boulton formula, Specific capacity, Transmissibility.
Identifiers: *Pump tests (wells), Hydraulic properties.

The nonequilibrium formula is widely used with pumping test data for determining the hydraulic properties of an aquifer. The most popular method for solving that formula is the straight-line method because of its simplicity of application and interpretation. However, the straight-line method is not applicable in some cases and it supplements, rather than supersedes, the more complicated type-curve method. Geologists and engineers have become familiar with the interpretation of time-drawdown graphs. Distance-drawdown graphs (radial profiles of cones of depression) have, on the other hand, received little publicity and they are not used as much as they ought to be to determine the hydraulic properties of aquifers and to confirm the existence of geohydrologic boundaries. Under complex aquifer conditions, early time-drawdown data can be misleading because of the inability of some aquifers to respond to pumping instantaneously as would a homogeneous, isotropic, and perfectly elastic artesian aquifer. Distance-drawdown data can be used to great advantage in the interpretation of early time-drawdown data. Under water-table conditions, the nonequilibrium formula does not describe completely the drawdown in wells during short periods of pumping. The gravity drainage of water through stratified sediments is not immediate and the unsteady flow of water towards a well in an unconfined aquifer is characterized by slow drainage of interstices. Thus, the coefficient of storage is not constant as assumed in the derivation of the nonequilibrium formula but varies and increases at a diminishing rate with the time of pumping. However, data collected towards the end of a pumping test, one or more days in duration, can in many cases by used to determine the hydraulic properties of an aquifer under water-table conditions. WELL DATA GLOSSARY,
American Petroleum Inst., Dallas, Texas.

A.P.I. Bulletin D-12, First Edition, April 1966. 115 p.

Descriptors: *Information retrieval, *Oil industry, Data Collections, Drilling, Wells.
Identifiers: *Well data terms, Standardization of terms, Data Abbreviations.

This Well Data Glossary is intended to present a list of suggested standards for well data terms that are in common use by the oil industry, particular in intercompany data systems, such as the Permian Basin Well Data System and the Rocky Mountain Well History Control System. With the oil industry involved in converting data to a machine retrievable form from literally hundreds of thousands of wells, the advantages of standardization bceome clear when the cost of making the Permian Basin the Rocky Mountain and a company well data system machine compatible is reckoned. When changes are made in an external data system , costs are again increased by the necessary reprogramming of that system and the resulting change in the company system. The more standards that each system accepts, the more time and money that is saved by the companies individually and collectively. The Glossary is designed for many users. Standard terms and abbreviations are for the data collectors, scouts, and commercial data companies. The codes, abbreviations and data fields are for those working with data conversion and retrieval problems. One of the primary uses for the Glossary is to define the data elements - those items requiring data fields. (Campbell-NWWA)

EROSION AND SEDIMENTATION FOLLOWING ROAD CONSTRUCTION AND TIMBER HARVEST ON UNSTABLE SOILS IN THREE SMALL WESTERN OREGON WATERSHEDS,
Forest Service, Portland, Oreg. Pacific Northwest Forest and Range Experiment Station.
R. L. Fredricksen.
Forest Service Research Paper PNW-104, 1970. 15 p, 5 fig, 4 tab, 15 ref.

Descriptors: *Landslides, *Sediment yield, *Clear-cutting, *Roads, *Oregon, Forest management, Sedimentation, Soil erosion, Erosion, Road construction, Watershed management, Cutting management, Lumbering.
Identifiers: Patch-cutting, *Logging roads.

In two steep headwater drainages in Oregon landslides were the predominant source of increased sedimentation of streams following timber harvest. Patch-cut logging with forest roads increased sedimentation relative to a control by more than 100 times over a 9-year period. Landslide erosion was greatest where roads crossed high gradient stream channels. In an adjacent clearcut watershed with no roads, sedimentation increased three times that of the control. A RAPID-FIELD SAMPLING SYSTEM FOR TRITIUM IN ATMOSPHERIC HYDROGEN,
Miami Univ., Fla.
H. G. Ostlund.
Availability: NTIS. TID-25345, Feb 1, 1970. 6 p.

Descriptors: *Tritium, *Measurement, *Instrumentation, *Sampling, *Air pollution, *Pollutants, Hydrogen, Oxygen, Water, Design criteria, Specifications.

A prototype field sampling system is presented for tritium in atmospheric hydrogen. Within a few weeks it will begin to undergo test, and final specifications will be determined. The machine will collect simultaneously one sample of atmospheric HTO, and one of HT, for each sampling period of 5 to 15 minutes. It is designed for use in an automobile or in an aircraft with pressurized cabin. During the remaining part of the first contract year, we will take the field unit in a car, station wagon or small van, and drive through a cold front collecting samples of atmospheric HTO and HT from both air masses. (Houser-NSIC)

RADIOACTIVE FALLOUT IN AIR AND RAIN--RESULTS TO THE MIDDLE OF 1969,
Atomic Energy Research Establishment, Harwell (England).
R. S. Cambray, E. M. Fisher, W. L. Brooks, and D. H. Pierson.
Availability: NTIS. AERE-R-6212, Nov 1969. 52 p.

Descriptors: *Sampling, *Atmosphere, *Air pollution, *Fallout, Measurement, Analytical techniques, Radioisotopes, Precipitation (Atmospheric), Tritium, Cesium, Strontium radioisotopes, Deposition (Sediment).

Sampling of dust and rainwater from the United Kingdom and elsewhere is reported. Results are presented of analyses of these samples for various fission products and certain other radionuclides. (Houser-NSIC)
W71-09492

RADIATION DOSIMETRY, CORRELATION, AND DATING OF CALCAREOUS DEEP-SEA CORES,
Dartmouth Coll., Hanover, N.H.
N. M. Johnson.
Availability: NTIS. NYO-3860-2, Feb 15, 1969. 103 p.

Descriptors: *Cores, *Age, *Geologic formations, *Oceans, *Sedimentary basins (Geological), *Radioactive dating, Mineralogy, Trace elements, Hydrologic data.

The method of obtaining geologic age relationships from the radiation dosimetry of natural thermoluminescence has been evaluated for deep-sea sediments. Dosimetry values and alpha activities were measured at intervals along five cores of foraminiferal lutite which collectively represent a complete stratigraphic section of the pleistocene. The mineralogy and concentrations of some trace elements in the cores were also determined and their effect on the natural thermoluminescence analyzed. (Houser-NSIC)
W71-09494

A QUICK METHOD FOR THE RADIOCHEMICAL DETERMINATION OF CESIUM-137 IN WATER (IN GERMAN),
Staatliche Zentrale fuer Strahlenschutz, Berlin (East Germany).
W. Rehak, and G. Ubl.
Availability: USAEC Depository Libraries in the U.S. and overseas. SZS-1/70, Jan 1970. 7 p, 2 fig, 6 ref.

Descriptors: *Cesium, *Radiochemical analysis, *Water, *Ion exchange, *Absorption, Measurement, Radiation.
Identifiers: Beta activity.

The radiochemical determination of CS-137 in water samples free of suspended matter is performed by an ion exchange procedure with ammonium molybdophosphate (AMP) and measuring the beta activity of the ion exchanger. A simple procedure for the preparation of AMP with good exchanging properties is described. (Houser-NSIC)

PHOSPHATE MEASUREMENTS IN NATURAL WATERS, A CRITIQUE,
Minnesota Univ., Minneapolis. Limnological Research Center.
William Chamberlain, and Joseph Shapiro.
Available from the National Technical Information Service as PB-200 824, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Contribution No 103, 1971, 20 p, 1 tab, 37 ref. OWRR Project B-099-Minn (4).

Descriptors: *Phosphates, *Lakes, Ecosystems, Minnesota, Hydrolysis, Ion-Exchange, Tracer, Bioassay, Arsenate, Seston, Analytical techniques, *Pollutant identification, Water pollution effects.
Identifiers: *Molybdenum blue method, Acid labile inorganic phosphate, Hidden blank error, Spectrophotometer, Dissolved phosphate.

The so-called molybdenum blue method for assaying the inorganic phosphate concentration of solutions is well established in scientific circles. Numerous modifications of the method have appeared and the method is the basis of almost all routinely

employed techniques for assaying phosphate in natural waters. This study was concerned with what, specifically, is being measured by the molybdenum blue method and whether or not the method is providing valid estimates of the dissolved inorganic phosphate concentration of natural waters. It is concluded that neither a hidden blank error or the hydrolysis of organic phosphate esters will seriously bias the results obtained by the molybdenum blue method. Except in instances where arsenate is a problem, the molybdenum-reactive material present in natural waters may be regarded as inorganic phosphate, although not necessarily as free phosphate ion. Any attempt to differentiate or define phosphorus availability without considering the time element is futile. If investigators continue to measure concentrations of dissolved inorganic phosphorus and refer to them as such that they be aware of certain problems and attempt to circumvent them. The adoption of a technique for surface waters is urged such as a 6-second procedure where arsenic is definitely shown to be absent, or a short period (e.g. 10 seconds) extraction technique where arsenic is, or may be, present, either method to be done on 0.5 micron filtered water. Only in this way will 'soluble reactive phosphorus' and 'dissolved inorganic phosphorus' begin to approach each other and only then, perhaps, will phosphate concentration estimates become meaningful. (See also W71-09564)
W71-09557

MECHANICAL SAMPLER FOR DETERMINING THE WATER QUALITY OF EPHEMERAL STREAMS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
S. Knedlhans.
Water Resources Research, Vol 7, No 3, p 728-730, Jun 1971. 3 p, 3 fig, 1 ref.

Descriptors: *Sampling, *Equipment, *Ephemeral streams, Monitoring, Water quality, Pollutant identification.
Identifiers: *Automatic samplers.

A simple mechanical system for automatically sampling small ephemeral streams is described. A rack fitted with two columns of bottles and a float assembly permits sampling of both rising and falling stages at predetermined water depths. (Knapp-USGS)

STATISTICAL LIMITS OF ACCURACY AND PRECISION OF GROSS ALPHA AND BETA RADIOACTIVITY MEASUREMENTS IN WATER,
Northeastern Radiological Health Lab., Winchester, Mass.
Edmond J. Baratta, and Forrest E. Knowles, Jr.
Radiological Health Data and Reports, Vol 12, No 4, p 195-198, April 1971. 4 p, 6 tab, 4 ref.

Descriptors: *Monitoring, *Radioactivity, *Pollutant identification, *Public health, *Statistics, Background radiation, Water analysis, Radiochemical analysis, Water quality, Sampling.
Identifiers: Alpha and beta radioactivity analysis (Water).

This paper presents the results of a technical experiment designed to determine the effectiveness of measurements for gross alpha and beta radioactivity in water. Since this analysis is normally used as a 'screening' technique, it is essential that the limits of precision and accuracy of the method be known. Gross measurements are still being used in preoperational reactor surveys as an indication of the 'background' levels and to monitor radioactivity when the reactor becomes operational. In addition, the Public Health Service standard for drinking water has, in lieu of a determination of radium-226 and strontium-90, limits for gross alpha and beta radioactivity, respectively. The precision and accuracy of a standard method for analysis of gross alpha and beta radioactivity in water were determined through the cooperation of private and government laboratories. It was found that gross alpha radioactivity could be determined with an overall precision of 12%, while the gross beta radioactivity could be determined with a precision of 7%. The accuracy of the gross alpha activity measurements was within 10%, and for the gross bet activity measurements, 1%. (Knapp-USGS)

SHORT-TERM FLUORESCENCE AND DISSOLVED OXYGEN RELATIONSHIPS IN THE UPPER CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
David A. Flemer, and Robert B. Biggs.
Chesapeake Science, Vol 12, No 1, p 45-47, March 1971. 2 fig, 7 ref.

Descriptors: *Dissolved oxygen, *On-site data collections, *Phytoplankton, *Fluorescence, *Sampling, On-site investigations, Hydrologic data, Pigments, Chlorophyll, Data collections, Heterogeneity.
Identifiers: *Chesapeake Bay, Chlorophyll a.

Short-term variations in fluorescence (chlorophyll a) and dissolved oxygen were recorded from a fixed station between 6 and 7 m over 12 m of water in upper Chesapeake Bay. The late afternoon curves showed a positive relationship and the early evening curves exhibited an inverse correspondence. The observed oscillations could result from internal waves but the variations in space and time may represent discrete patches of phytoplankton that move past the fixed sampling point. These results have important ecological consequences and may, or should, affect future sampling regimes of the estuary. (LeGore-Washington)

WHAT DO WE MEAN BY POLLUTION,
Iowa State Univ., Ames. Dept. of Economics.
Charles Gratto.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 1-6.

Descriptors: *Environment, *Water quality, Water pollution effects, Standards, Waste disposal, Ecosystems, Costs, Taxes, Prices.
Identifiers: *Socioeconomic characteristics, Fines and penalties, Adversary situation, Inducements.

Environmental quality is measured by some standard, such as content, and by performance. We can measure environmental quality by comparing an existing content with a desired content. Likewise, we can evaluate environmental quality by comparing an existing level of performance with a desired level of performance. One important performance characteristic of environment is balance over time. The content and performance standards we apply to the environment let us determine if this dynamic balance is being maintained. Problems of environmental quality would be easier to solve if we knew the tolerable levels of concentration for all kinds of matter and energy that a relevant to managing the environment. Public policies for reaching a desired level of quality include learning, fines and penalties, the adversary situation, inducements and cooperation, taxation, and the price system. (See also W71-09752) (White-Iowa State)

DETERMINATION OF MERCURY BY USING A GOLD TRAP IN SAMPLES CONTAINING CONSIDERABLE SULFIDE MINERALS,
Geological Survey of West Malaysia, Ipoh.
P. C. Leong, and H. P. Ong.
Analytical Chemistry, Vol. 43, No. 7, June, 1971, p. 940-941, 1 fig., 2 tab.

Descriptors: Equipment, Absorption, *Pollutant identification, Analytical techniques.
Identifiers: *Mercury, Reagents, Dithizone, Gold trap, Sulfide minerals.

This article offers a suitable method for determining microamounts of mercury in soil and rock samples which may contain considerable amounts of sulfide minerals. The equipment consists of a borosilicate test tube 19 mm o.d. x 150 mm joined to an L-shaped borosilicate glass tubing of 9 mm (o.d). The horizontal part of the tubing holds a column of cut up gold foil. The other end of the tubing is dipped into an absorbing mixture consisting of 0.2 M potassium permanganate solution diluted with an equal volume of 10 percent sulfuric acid. Dithizone, 0.0015 percent, was prepared fresh daily by diluting 15 ml of 0.01 percent solution to 100 ml with chloroform. A test tube con-

aining the absorption mixture was placed in a flask which was in turn connected to a suction pump. The sample is heated and suction pressure is applied. The absorption mixture is decolorized with a slight excess of sulfurous acid, and 1 ml of dithizone solution is added. Mercury content is determined by comparing the color of the organic layer in the organic layer in the absorbing mixture with the set of standards. Results from tests using synthetic samples indicate that the method gives reasonably good results and should be useful to laboratories having no sophisticated instruments. (Upadhyaya-Vanderbilt)

THE COMPLEX CHEMISTRY OF METHYLMERCURY CATIONS (IN GERMAN),
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Lab. of Inorganic Chemistry.
G. Schwarzenbach, and M. Schellenberg.
Helvetics Chemica Acta, Vol. 48, Fascicutus 1 (1965), No. 3, p. 28-48, 3 fig., 19 ref.

Descriptors: *Heavy metals, *Chemical reactions, Metals, Analytical techniques, Organic compounds, Carbohydrates, Path of pollutants, Biochemistry, Chemical properties, Water pollution sources, Pollutant identification.
Identifiers: *Mercury, Mercury pollution, *Methylmercury.

The stability constants of the methylmercury complexes CH3HgL1 - lambda with a considerable number of ligands L lambda - have been determined (Table 1). Like H-, the cation CH3Hg.. reveals the coordination number 1 almost exclusively. Some ligands form also binuclear adducts (CH3Hg)2L 2-lambda and sulfide even forms (CH3Hg)3S-. The coordination behaviours of CH3Hg.. and H.. however are very different concerning the selection of ligands, the former being a soft and the latter a hard acid in the sense of PEARSON. The entropy, delta S, of the reaction: H (..) ..L- yield HL is more positive by about 14 e.u. than delta S of the reaction: CH3Hg (..) ..L- yield CH3HgL. The hydrogen ion in aqueous solution has a far greater order producing action on the solvent than CH3Hg... Two dyes also have been investigated, which may serve as indicators for CH3Hg.. and for the determination of pCH3Hg (—log (CH3Hg-)). (Novotny-Vanderbilt)

A COMPREHENSIVE STUDY OF SAN FRANCISCO BAY,
California. University of Berkeley. Sanitary Engineering Research Lab.
E. A. Pearson, P. N. Storrs, and R. E. Selleck.
California State Water Resources Control Board Publication 42, 1971, p. 85, 8 fig, 17 tab, 24 ref. SERL Report No. 67-5.

Descriptors: *Bays, *Physical properties, *Chemical analysis, *Sampling, *Waste disposal, *Tidal effects, *Sedimentation, *Biology, *Fisheries, Water quality, Analytical techniques, Monitoring.
Identifiers: *San Francisco Bay, Interrelationships.

The State Water Quality Control Board conducted a comprehensive study of San Francisco Bay. The investigation was to determine existing water and sediment quality for quantitative inventory of waste discharges in the Bay, and to determine the effect or influence of significant waste discharges on the aquatic environment of the Bay. Included in the investigation were: physical, chemical and microbiological sampling and analytical methods; biological sampling and analytical methods; waste discharges and loadings; physical and hydrological characteristics; physical, chemical and biological water and sediment data; water and sediment quality and waste discharge relationships and a model of mixing and diffusion. This report summarizes the entire investigation with conclusions and recommendations. (Ensign-PAI)

E. Reynolds.
Health Physics, Vol. 20, No. 3, p 241-251, March 1971, 11 fig, 2 tab, 14 ref.

Descriptors: *Monitoring, *Waste disposal, *Radioactive waste disposal, Methodology, Technology, Application equipment, Design criteria.
Identifiers: *Irish Sea, *In-situ monitoring, *Constant Geometry approach, Seabed gamma probe.

An in situ seabed gamma monitoring device is described and its application theory explained. Essential design requirements of any in situ seabed gamma monitor include constant detector-to-sample geometry, adequate sensitivity and reliable performance, portability, and spectrometric facilities. Experimental results obtained in the Irish Sea are compared with results from seabed samples analysed in the laboratory. The efficacy of the method for the rapid assessment of the intensity of the seabed gamma field arising from radioactive waste disposal is indicated by the correlation between the two sets of data. W71-09798

PARTICULATE Pb, Pb 210 AND Po 210 IN THE ENVIRONMENT,
Batelle Memorial, Richland, Wash. Pacific Northwest Labs.
J. C. Langford.
Health Physics, Vol. 20, No. 3, p 331-336, March 1971, 3 tab, 34 ref.

Descriptors: *Pacific Ocean, *Atlantic Ocean, *Lead radioisotopes, *Measurement, *Fallout, Water pollution sources, Pollutant identification.
Identifiers: *Polonium-210, *Particulate matter, Industrial wastes, Engine emissions.

Particulate Pb, 210Pb and 210Po were measured in the Pacific Ocean west of Newport, Oregon and in Atlantic Ocean between the Bahama Islands and Sierra Leone, Africa. In the Pacific Ocean specific activity of 210Pb increased with depth due to the decreasing concentrations of stable Pb with depth. In the Atlantic Ocean the average particulate 210Po concentration was 20% higher than the average 210Pb concentration yet both isotopes were about one-tenth their radio-equilibrium concentrations from 226Ra. The particulate stable Pb concentration in the Atlantic Ocean decreased ninefold. Pb concentrations are thought to be from vehicular and industrial sources transported to the marine environs by atmospheric processes. (Ensign-PAI)
W71-09799

NATIONAL MONITORING PROGRAM FOR THE ASSESSMENT OF PESTICIDE RESIDUES IN WATER,
Geological Survey, Arlington, Va; and Environmental Protection Agency, Washington, D.C.; and Water Quality Office, Athens, Ga.
H. R. Feltz, William T. Sayers, and H. P. Nicholson.
Pesticides Monitoring Journal, Vol 5, No 1, p 54-62, June 1971. 9 p, 1 fig, 1 tab, 23 ref.

Descriptors: *Monitoring, *Pesticide residues, *Sampling, Water supply, Surface waters, Groundwater, Rainfall, Surveys, Analytical techniques, Water analysis, Pollutant identification, Water pollution sources.
Identifiers: *Pesticide monitoring.

The proposed design of the program for monitoring pesticide residues in the hydrologic environment is a revision of the program initiated in 1967 by the Federal Water Pollution Control Administration and the U.S. Geological Survey and provides for a continuing assessment of the general levels of pesticides in the water and bottom sediments of the Nation's water courses. Water samples collected quarterly and bed material samples collected semiannually at 161 sites in the conterminous United States, Alaska, Hawaii, and Puerto Rico will be examined for the presence of pesticide residues. Sampling sites were chosen at random from hydrologic units within the major drainage basins defined by the Water Resources Council. Analyses will be performed using separation and identification techniques currently acceptable to the scientific community, and the data evaluation will be published in the Pesticides Monitoring Journal. (Knapp-USGS)
W71-09802

DETERMINATION OF TRACE QUANTITIES OF NITRILOTRIACETIC ACID BY DIFFERENTIAL CATHODE-RAY POLAROGRAPHY,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
Badar K. Afghan, and Peter D. Goulden.
Environmental Science and Technology, Vol 5, No 7, p 601-606, July 1971. 6 p, 8 fig, 4 tab, 12 ref.

Descriptors: *Polarographic analysis, *Pollutant identification, *Detergents, *Chemical analysis, Chelation, Surfactants, Nitrogen compounds, Organic compounds.
Identifiers: *Nitrilotriacetic acid, NTA.

Two methods for the determination of nitrilotriacetic acid in natural water and detergents are proposed, depending upon the nature of the sample. Determination of 'free' NTA in natural water is based on the formation of a lead-NTA complex in alkaline medium at pH 8.0 using differential cathode-ray polarography. Determination of 'total' NTA is based on releasing NTA from metal complexes under acid conditions. The subsequent addition of EDTA and return of the sample to pH 8, preferentially bind the metals with EDTA. This frees NTA from metal complexes and the released NTA is then determined by lead-NTA method. The procedure for determination of NTA content in detergents utilizes bismuth-NTA reduction wave at pH 2.0. The method is capable of detecting as little NTA as 10 micrograms/liter without any preconcentration of the sample. (Knapp-USGS)
W71-09805

RADIOECOLOGICAL INVESTIGATION IN THE REGION OF MURUROA ATOLL (TUAMOTU ISLAND),
Institute of the Biology of the Southern Seas, Sevastopol (USSR).
A. N. Kolesnikova, G. V. Barinov, and A. Ya. Zesenko.
Available from NTIS. Report AEC-tr-7024, p 180-185 (Radiobiologiya, Vol. 9, No. 1, p 139-143 (1969)). 3 fig, 3 tab, 4 ref.

Descriptors: *Radioactivity effects, *Crayfish, *Radioisotopes, *Plankton, Fallout, Pacific Ocean, Oceanography, Atolls, Gamma rays, Spectroscopy, Instrumentation.

Data are presented from the 20th voyage of the oceanographic ship Mikhail Lomonosov through former and present day atomic firing ranges. The gamma spectra of sample of zooplankton showed the presence of cerium-141 and -144, zirconium-95, niobium-95, and ruthenium-103 in concentra-

tions from 0.16 to 12 pCi per kg of live weight. In the region of Mururoa Atoll, the French atomic firing range, anomalous crayfish were detected, the number of which was proportional to the radioactivity of the plankton. (Bopp-NSIC)
W71-09848

NATURAL AND ARTIFICIAL RADIONUCLIDES IN SEAFOODS AND MARINE PROTEIN CONCENTRATES,
Oregon State Univ., Convallis. Dept. of Oceanography.
Thomas M. Beasley, Charles L. Osterberg, and Yvonne M. Jones.
Nature, Vol 221, p 1207-9, 1969, 3 tab, 19 ref.

Descriptors: *Food chains, *Marine animals, *Radioisotopes, *Analytical technique, Instrumentation, Absorption, Lead radioisotopes, Cobalt radioisotopes, Radium radioisotopes, Human population.
Identifiers: Cesium radioisotopes, Manganese radioisotopes, Thorium radioisotopes, Polonium radioisotopes.

Radionuclide concentrations in seafoods were far below a hazardous level, but continued use of marine protein concentrates could result in the polonium-210, lead-210 pair becoming the principal source of the skeletal dose. Ra-226, Th-228, and the gamma-emitting radionuclides, Co-60, Mn-54, and Cs-137 were determined by gamma counting using multidimensional gamma spectrometry; Po-210 and Pb-210 by oxidation of organic matter in HClO4-HNO3 and deposition Po-210 on pure silver, and separation of Pb-210 from the plating matrix. IMPLICATIONS OF CROP-PRODUCTION TECHNOLOGY FOR ENVIRONMENTAL QUALITY,
Illinois Univ., Urbana. Dept. of Agronomy.
S. R. Aldrich, W. R. Oschwald, and J. B. Fehrenbacher.
Environmental Geology Notes, Illinois State Geological Survey, No 46, p 7-24, May 1971. 8 fig, 6 tab, ref.

Descriptors: *Agriculture, *Environment, *Farm wastes, *Crop production, Farm management.
Identifiers: *Crop-production technology, Environmental quality.

Illinois is used as a model to examine some effects of technology on the environment. The effects of selected modern crop production technologies are examined, including the use of nitrogen and phosphorus as fertilizers. Recent restrictions on the use of certain production technologies and attacks on fertilizer use have led to analysis in greater detail of the possibilities for an consequences of producing crops with less use of available technology. Return to more primitive agricultural methods, however, is regarded as unwise. The justification for using each practice and subsystem of production must be challenged to insure the least undesirable impact on the environment. The utilization of the best available crop-production technology will likely meet the needs of society with the least harm to the environment. (Wray-Chicago)

SURVEY OF ENVIRONMENTAL RADIOACTIVITY FOR PERIOD JANUARY 1, 1969 TO JUNE 30, 1969,
Iowa State Univ. of Science and Technology, Ames.
M. D. Voss.
Availability: NTIS. Ames Laboratory, IS-2154, Aug 1969. 20 p.

Descriptors: *Environment, *Environmental effects, *Sampling, *Water, *Air, *Sedimentation, Water pollution, Nuclear reactors, Research equipment, Effluents, Fallout, Precipitation (Atmospheric).

The environmental program consists of air samples, soil, vegetation, river water, bottom sediment, precipitation, pond water, ALRR outfall, and well water samples. The ALRR reached full power as of 7/12/65. The data indicate that the ALRR has not contributed a significant amount of radioactivity to the environment in the Ames area. (Houser-NSIC)
W71-09496

RADIOLOGICAL STATUS OF THE GROUNDWATER BENEATH THE HANFORD PROJECT, JANUARY-JUNE, 1968,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
T. H. Essig.
Availability: NTIS, US Department of Commerce, Springfield, Virginia, ($3.00 per copy; $0.95 microfiche). Battelle-Northwest BNWL-984, Jan 6, 1969. 20 p, 2 fig, 6 tab, 5 ref.

Descriptors: *Groundwater, *Groundwater movement, *Water pollution, *Water pollution control, *Water pollution effects, *Water pollution sources, Effluents, Soil water movement, Sediments, Radioactive well logging, Radioactivity effects.

More than 500 wells have been drilled to groundwater on the Hanford project for surveillance of radionuclide movement through sediments both above and below the regional water table. This report provides an evaluation of the status of groundwater contamination resulting from disposal of plant effluents. Total beta concentrations in the unconfined and confined groundwater aquifers are presented. Results are tabulated for well-water samples in which total beta concentrations exceeded the analytical limit. The average concentrations for the previous report period are listed for comparison. (Houser-NSIC)
W71-09497

BETA RADIOACTIVITY IN ENVIRONMENTAL AIR AND PRECIPITATION AT LOS ALAMOS, NEW MEXICO, FOR 1969,
Los Alamos Scientific Lab., N. Mex.
W. R. Kennedy, and J. W. Aeby.
Availability: NTIS. LA-4388, Jan 1970. 10 p, 3 fig.

Descriptors: *Environment, *Air pollution, *Precipitation (Atmospheric), Sampling, Water, Water pollution, Water pollution sources, Fallout, Nuclear explosions.
Identifiers: Beta activity, Concentration, Los Alamos, New Mexico nuclear detonations, Testing.

Beta activity of particulate matter in both air and precipitation for 1969 are reported for Los Alamos, New Mexico. The gradually increasing levels in both air and water samples from January through July reflect a contribution from foreign fallout arriving at our station as well as greater than average rainfall. The slight upward trend in October is a normal seasonal upswing. (Houser-NSIC)
W71-09498

SURVEY OF ENVIRONMENTAL RADIOACTIVITY,
Ames Lab., Iowa.
M. D. Voss.
Availability: NTIS. IS-2025, Jan 1969. 40 p.

Descriptors: *Environment, *Monitoring, *Pollutant identification, *Air pollution, *Water pollution, *Soil contamination, Water pollution sources, Surface waters, Rivers, Water holes, Ponds, Water wells, Sedimentation, Sampling, Analytical techniques, Nuclear reactors.
Identifiers: Gross alpha, Gross beta, Concentration, USAEC-Site, Ames laboratory, Research reactor.

The environmental radiation monitoring program of the American laboratory is described. The program consists of gross alpha and beta determinations of air, soil, vegetation, river water, Ames Laboratory Research Reactor (ALRR) outfall, bottom sediment, precipitation, well water, and pond samples. The data indicate that the ALRR has not contributed a significant amount of radioactivity to the environment in the Ames area. (Houser-NSIC)
W71-09499

RADIOLOGICAL STATUS OF THE GROUNDWATER BENEATH THE HANFORD PROJECT, JULY-DECEMBER 1969,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
D. H. Benham.
Availability: NTIS. BNWL-1392, May 1970. 20 p, 3 fig, 5 tab, 5 ref.

Descriptors: *Groundwater, *Radioisotopes, *Tritium, *Ions, *Nitrates, Measurements, Evaluation, On-Site investigations, Water pollution, Soil contamination, Water pollution sources, Standards.
Identifiers: Ruthenium, Nitrate ions, Concentration, Hanford site.

Surveillance of the groundwater beneath the Hanford site is reported. The concentration of the ruthenium, tritium, and nitrate ions in the area groundwater is considered. These concentrations are evaluated in terms of their respective concentrations guides and to PHS drinking-water standard. (Houser-NSIC)
W71-09500

1966 ENVIRONMENTAL MONITORING RADIATION LEVELS AT BROOKHAVEN NATIONAL LABORATORY,
Brookhaven National Lab., Upton, N.Y.
A. P. Hull, and J. T. Gilmartin.
Availability: NTIS. BNL-50196, Sep 1969. 32 p, 20 fig, 32 tab, 29 ref.

Descriptors: *Monitoring, *On-site data collections, *Sampling, *Nuclear reactors, *Measurement, *Background radiation, *Operations, Effluents, Gases, Particle shape, Particle size, Research facilities, Liquid wastes, Water pollution, Rivers, Radioisotopes.
Identifiers: Graphite research reactor, Particulates, Peconic River, High flux beam research reactor.

Measurements of natural background radiation levels and of increments attributable to laboratory operations obtained on site and in the vicinity of Brookhaven National Laboratory during 1966 are summarized. These increments include contributions from the gaseous and particulate effluent from the stack serving the Brookhaven Graphite

Research Reactor and the High Flux Beam Research Reactor, from multicurie field gamma sources, and from the discharge of low-level liquid wastes from the Laboratory's sanitary waste treatment plant into the headwaters of the Peconic River. (Houser-NSIC)

RADIOACTIVE WASTE DISCHARGES TO THE ENVIRONMENT FROM NUCLEAR POWER FACILITIES,
Bureau of Radiological Health, Rockville, Md. Div. of Environmental Radiation.
Joe E. Logsdon, and Robert I. Chissler.
Availability: NTIS PB-190 717. Bureau of Radiological Health, BRH/DER-70-2, March 1970. 76 p, 4 fig, 10 tab, 9 App.

Descriptors: *Nuclear power plants, *Liquid wastes, *Gases, *Nuclear waste, *Effluent, *Environment, Waste dilution, Waste disposal, Waste identification, Regulation management, Permits, Treatment facilities.

Data pertaining to discharges of radioactive liquid and gaseous wastes from nine selected operating nuclear power facilities are presented and discussed. Experience to date with nuclear power plants has shown that careful waste management practices, engineered safeguards, and proper operating procedures generally result in radioactivity levels in waste effluents of a few percent or less of the AEC's licensed discharge limits. Technical Specifications for all facilities limit liquid discharges such that average annual concentrations of radioactivity in the condenser cooling discharge canal will be less than values listed. Facility operating reports, which are prepared to demonstrate that the facility operator is in compliance with specific requirements of the operating license, vary widely as to units used and types of information concerning discharges of radioactive wastes. In general, there is a paucity of information in these reports concerning specific radionuclides discharged. A number of comparisons have been made of power produced versus liquid or gaseous waste discharges. The most predominant trends shown in these comparisons are that boiling water reactors discharge relatively large quantities of gaseous waste and pressurized water reactors discharge relatively high quantities of tritium in liquid wastes. Information is available concerning the type of waste treatment facilities installed at each nuclear power station. (Houser-NSIC)

FINAL REPORT OF OFF-SITE SURVEILLANCE FOR PROJECT PALANQUIN.
Southwestern Radiological Health Lab., Las Vegas, Nev.

Availability: NTIS. PNE-910-F, May 1970. 128 p.

Descriptors: *Monitoring, *Nuclear explosions, *Testing, *Population, *Radioactivity, *Radioactivity effect, Environment, Sampling, Air pollution, Water pollution, Water pollution sources, Vegetation, Data collections, Public health, Hazards.
Identifiers: Concentration, Nevada test site, Off-site work, Surveillance program.

Off-site surveillance is reported in support of the Palanquin event conducted on April 14, 1965. Support consisted of tracking the effluent, monitoring radiation dosage to the off-site population, and collecting environmental samples (air, milk, water, and vegetation). Analyses of radiological data indicate that radioactive effluent arising from this event did not present any health hazard to the off-site population, based on presently accepted safety criteria established by the USAEC. ASPECTS OF THE RELEASE OF RADIOACTIVE MATERIALS FROM NUCLEAR INSTALLATIONS INTO THE ENVIRONMENT AND THE CONSEQUENCES FOR THE DISPOSAL OF RADIOACTIVE SEWAGE. (IN GERMAN),
Staatliche Zentrale fuer Strahlenschutz, Berlin (East Germany).
W. Rohnsch.
Availability: USAEC Depository Libraries in the U.S. and Overseas. SZS-16/69, Dec 1969. 21 p, 1 tab, 8 ref.

Descriptors: *Environment, *Effluents, *Nuclear power plants, *Nuclear wastes, *Population, *Regulation, Standards, Surface waters, Radiation, Rivers, Oceans, Radioactivity effects, Water pollution sources.
Identifiers: Baltic Sea, Maximum permissible burden, Germany.

The importance of the environmental capacity for the release of radioactive materials from nuclear installations is pointed out. Its dependence on natural characteristics and the utilization of the environment as well as on the maximum permissible radiation burden of the inhabitants is discussed,

especially for surface waters. From the basic principle of radiation protection the request for a well-founded minimum exploitation of the environmental capacity is derived. An estimation of the capacity of the surface waters of the G.D.R. and the Baltic Sea shows that for a long time the disposal of low-level radioactive wastes is possible when all the possible means of the water processing facilities are applied and permanently improved. LOW-LEVEL RADIOACTIVE WASTE TREATMENT - THE WATER RECYCLE PROCESS,
Oak Ridge National Lab., Tenn.
W. C. Yee, F. Delora, and W. E. Shockley.
Availability: NTIS. ORNL-4472, July 1970. 30 p.

Descriptors: *Waste water treatment, *Radioactive wastes, *Water quality, *Water reuse, Environment, Ion exchange, Water conservation, Water purification, Water quality act, Waste disposal.
Identifiers: Water recycling, Pilot plant, Waste disposal liquid.

The water recycle process was developed for decontaminating low-level radioactive aqueous wastes and recycling the purified water for reuse at nuclear installations. This process was successfully demonstrated through several cycles in a micropilot plant, using ORNL waste that contained low concentrations of salts and radionuclides. The recycle of water should be an improvement over present methods in which the wastes are decontaminated and the purified water is discharged to the environment. (Houser-NSIC)

HYDRAULIC TESTING OF THE OJO ALAMO SANDSTONE IN HOLE GB-3, PROJECT GASBUGGY, RIO ARRIBA COUNTY, NEW MEXICO,
Geological Survey, Denver, Colo.
J. E. Weir, Jr.
Available from National Technical Information Service, Springfield, Va. - Price $3.00 printed copy; 95 cents microfiche. Geological Survey Open-file Report, USGS-474-91 (AEC), 1971. 26 p, 5 fig, 6 tab, 2 ref.

Descriptors: *Aquifer characteristics, *Groundwater movement, *Water pollution sources, *Nuclear explosions, *New Mexico, Bore holes, Fractures (Geology), Water level fluctuations, Permeability, Sandstones, Aquifers, Transmissivity, Radioactivity, Water analysis, Testing, Test procedures, Analytical techniques, Natural gas, Hydrologic data, Data collections, Geology, Hydrogeology, Water temperature, Groundwater, Chemical analysis, Water pollution sources, Radiochemical analysis, Path of pollutants.
Identifiers: *Aquifer evaluation, *Rio Arriba County (N Mex), Swabbing tests.

Hydraulic tests were made August 24 to September 2, 1969, in the Ojo Alamo Sandstone of Cretaceous age in hole GB-3, drilled about 20 months after the Gasbuggy explosion. The tests were made to determine whether increase in fracture permeability occurred as a result of the Gasbuggy experiment to stimulate gas production from a low yield reservoir by a nuclear explosion. The lower part of the formation, 3,564 to 3,686 feet below ground level, had a transmissivity (T) of 1.56 gallons per day per foot. Comparing this value with the value for T (2.64 gallons per day per foot), determined before the explosion for virtually the same stratigraphic interval in hole GB-1 in February 1967, suggests either that the Gasbuggy experiment fractured none of the lower Ojo Alamo Sandstone at hole GB-3 or that fracturing was insufficient to manifest itself through a permeability increase. A water sample from hole GB-3, as compared to a sample collected prior to the explosion from the same interval in hole BG-1, indicates a slight increase in radioactivity following the Gasbuggy experiment. (Woodard-USGS)

Akademiya Nauk SSSR. Sibirskoye Otdeleniye. Geologiya i Geofizika, No 12, p 121-125, December 1970. 5 p, 2 tab, 6 ref.

Descriptors: *Water chemistry, *Groundwater, *Surface waters, *Molybdenum, *Heavy metals, Salts, Connate water, Organic matter, Geochemistry.
Identifiers: *USSR, *Mercury, Transbaykal, Chita Oblast, Gorno-Altaysk Autonomous Region, Molybdenite, Mineralization, Country rock.

The content of mercury in ground- and surface waters of two molybdenum deposits in Eastern Transbaykal and in the Amazar River valley (Chita Oblast) and Sary-Dzhaz River basin (Kirghiz SSR) is more or less constant, varying between 1.8 and 5.6 millionths of a g/liter. Mercury in the water samples was determined in three forms: by total mercury content, by mercury precipitated by hydrogen sulfide, and by mercury bound in stable mercury organic compounds, which was most stable to long distance migration. The predominant form of mercury for all samples was Hg (OH)2. The mercury content in the waters examined was similar to that in the ground- and interstitial waters of the Aktash mercury deposit in the Gorno-Altaysk Autonomous Region. (Josefson-USGS)

BIOGEOCHEMICAL DISPERSION HALOS OF TIN IN A MONSOON CLIMATE OF THE SOUTHERN PART OF THE SOVIET FAR EAST (Russian: Biogeokhimicheskiye oreoly rasseyaniya olova v usloviyakh mussonnogo klimata yuga Dal'nego Vostoka),
Khabarovskii Kompleksnyi Nauchno-Issledovatelskii Institut (USSR).
V. V. Bardyuk, and P. V. Ivashov.
Akademiya Nauk SSSR. Sibirskoye Otdeleniye. Geologiya i Geofizika, No 12, p 125-132, December 1970. 8 p, 5 fig, 2 tab, 20 ref.

Descriptors: *Plants, *Soils, *Water chemistry, *Soil-water-plant relationships, Metals, Geochemistry, Biochemistry, Surface waters, Groundwater, Connate water, Aqueous solutions.
Identifiers: *USSR, *Maritime Territory, *Tin, *Dispersion halos, Silver, Lead, Ore bodies, Geobotany, Ash content.

Studies were conducted at several tin deposits in the coniferous forests of the Sikhote Alin and Myao-Chan range, using the biogeochemical method of prospecting to determine and explain tin distribution in plants and soils. Despite its extremely weak mobility in the supergene zone, tin produces true dispersion halos in plants growing above ore bodies in all of the landscape zones and does not form biogeochemical anomalies outside

the zones of mineralization. A tin content of 0.001% in the surface waters of an ore field and a tin content of 0.03-0.06% in the waters of an ore zone attest to the migration of tin in aqueous solutions. The tin concentration in the ash content of plants above an ore zone is 10-300 times that in non-ore areas. Tin and most other metals, including lead, copper and silver, are accumulated in soils in the lower part of the profile below 30-40 cm. A very weak relationship (0.1) exists between the tin content of soils and plants; a closer relationship (0.37) is observed for lead. The biogeochemical method precludes the possibility of 'false' biogeochemical anomalies of tin and provides for sharply contrasting anomalies, a large number of accumulator plants and simplified plant sampling. (Josefson-USGS)

PHYSICAL (HYDRAULIC) MODELING OF HEAT DISPERSION IN LARGE LAKES: A REVIEW OF THE STATE OF THE ART,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
Edward Silberman, and Heinz Stefan.
Available from National Technical Inf Service, Springfield, Va 22151 - Price $3.00 (printed copy); $0.95 (microfiche). Argonne National Laboratory Center for Environmental Studies Report ANL/ES-2, August 17, 1970. 110 p, 18 fig, 8 tab, 102 ref. Subcontract 31-109-38-2404 Argonne Nat Lab.

Descriptors: *Reviews, *Hydraulic models, *Bibliographies, *Dispersion, *Heated water, Thermal pollution, Thermal powerplants, Model studies, Path of pollutants, Mathematical models, Jets, Lakes.
Identifiers: Thermal plumes, Heat dispersion.

A survey was made of the state of knowledge of heat dispersion from steam generating plants into large lakes. The prospects and problems associated with physical or hydraulic modeling of thermal plumes and heat dispersion are reviewed. The studies reviewed include: physical concepts of thermal plumes derived from fundamental experimental studies and criteria for hydraulic modeling of dispersion; adaptability of hydraulic models to providing parameters for and checking of mathematical models; and case histories of hydraulic models applied to predicting thermal plumes at actual power plants. The materials reviewed include both published and unpublished literature, as well as direct interviews, mostly by long-distance telephone. (Knapp-USGS)

PESTICIDES IN WATER,
Federal Water Pollution Control Administration, Corvallis, Oregon. Pacific Northwest Water Lab.
Richard B. Marston, Robert M. Tyo, and Stephen C. Middendorf.
Pesticides Monitoring Journal, Vol 2, No 4, p 167-171, March 1969. 4 fig, 2 tab, 2 ref.

Descriptors: *Endrin, *Application methods, *Water pollution sources, *Watershed management, *Drainage, *Runoff, Seed treatment, Pesticide residues, Pesticide drift, Agricultural chemicals, Hazards, Forest management, Watersheds (Basins), Clear-cutting, Oregon.
Identifiers: Pesticide runoff, Salado (Oregon).

A 175 acre 'clear-cut' watershed in the headwaters of the Alsea River near Salado, Oregon was reseeded on January 23, 1967, by the conventional practice of aerially broadcasting endrin-coated Douglas Fir seed. Measurable amounts of endrin were detected in streamflow for 2 hrs after seeding started and again during the high flow of a winter freshet that occurred the sixth day after seeding. The total amount of endrin found in these two periods of runoff amounted to 0.006 lb/square mile, or 0.12% of the endrin used to treat the seed. This was much lower than the results obtained in the laboratory (11.3%) from soaking endrin-treated seed in distilled water for 32 days. (LeGore-Washington)

ON THE SIGNIFICANCE OF METAL COMPLEXING AGENTS IN SECONDARY SEWAGE EFFLUENTS,
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
Michael E. Bender, Wayne R. Matson, and Robert A. Jordan.
Environmental Science and Technology, Vol 4, No 6, p 520-521, June 1970. 1 fig, 1 tab, 11 ref. FWPCA Grant 1-FI-WP-26-294-01, NIH Grant 5-501-FR-05447-07.

Descriptors: *Water pollution effects, *Organic wastes, *Eutrophication, *Chelation, *Sewage, *Organic compounds, Water pollution treatment, Water pollution sources, Environmental sanitation, Secondary treatment, Aquatic algae, Primary productivity, Trace elements, Phosphates, Nitrates, Laboratory tests.
Identifiers: *Chelators, Anodic stripping, Organic chelators.

Several components of secondary sewage other than phosphorous and nitrogen could be abetting lake eutrophication. The chelation of metals by organic compounds has been demonstrated to cause significant increases in algal production. This study was an attempt to find such chelators in secondary sewage effluents. Two distinct metal-complexing molecular weight fractions were demonstrated using recent advances in anodic stripping techniques. One fraction has a molecular weight similar to that of synthetic chelators and has proven effective in stimulating algal growth. Subsequent investigations are attempting to rule out the possibility that other substances in sewage fractions could be responsible for the apparent stimulation. (LeGore-Washington)

PRELIMINARY REPORT ON THE BENTHIC FAUNA OF THE RIVER TESHIO (In Japanese),
Mitsuaki Atoda, Kiyoshi Yoshizumi, Teruhiko Awakura, Toshitake Asano, and Tomiko Ito.
English summary. Scientific Reports of the Hokkaido Fish Hatchery, No 24, p 97-114, Dec 1969. 1 fig, 1 tab, 8 ref.

Descriptors: *Ecotypes, *Streambeds, *Benthic fauna, Speciation, Varieties, Stream erosion, Running waters, Aquatic animals, Insects, Midges, Stoneflies, Caddisflies, Mayflies, Oligochaetes, Resistance, Physiological ecology, Environmental effects.
Identifiers: *Stream fauna, Species diversity, Japan, Leeches, Earthworms, Gamarus sp, Teshio River Japan, Diversity.

The benthic fauna at eleven stations on the Teshio River, Japan, and at fourteen stations on twelve of its tributaries was examined. The upper Teshio River's benthos was diverse, and consisted largely of relatively sensitive organisms. From Nayoro City downstream, the species diversity decreased and a progressively larger proportion of the organisms were of 'tolerant' species. Six tributaries had 'good' bottom conditions and held diverse populations, but the other six tributaries contained poorly diversified faunal collections. The predominant bottom gravels and sands were considered the major influences on the poor species diversity in the lower Teshio River. (LeGore-Washington)

CAN GROUNDWATER POLLUTION BE AVOIDED,
Missouri Geological Survey, Rolla.
J. H. Williams.
Groundwater, Vol 7, No 2, p 21-23, March-April 1969.

Descriptors: *Water pollution, *Groundwater, *Missouri drilling, Water pollution control, Water pollution effects, Water pollution sources.
Identifiers: Missouri generalized geology.

Pollution of groundwater to the point of crisis in Missouri can be eliminated by an awareness of geology, by planning, by adequate funding, and by authority to follow planning. Groundwater pollution hazards are widespread in southern Missouri where permeable soils'1nd cavernous bedrock exist. Pollution in northern Missouri is more localized. All of the pollution in Missouri that we have attributed to geologic features could have been avoided if the polluters - municipal and private had obtained adequate geologic information, used common sense, and supported waste disposal plans with adequate financing. SEDIMENT: EVERYBODY'S POLLUTION PROBLEM,
Soil Conservation Service, Washington, D.C.
Kenneth E. Grant.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 67-76, 1 tab, 8 ref.

Descriptors: *Sediment, Water pollution effects, *Sedimentation, Agriculture, Soil erosion, Right-of-way, Soil, Farm waste, Water quality, Watersheds, Flood damage, Value, Benefits, Soil surveys, Research and development, Land management.
Identifiers: Nonfarm sources, Soil Conservation Service, Soil capability, Universal Soil Loss Equation, Wind Erosion Equation, Mulch tillage, Conservation Needs Inventory.

Sediment is the nation's largest pollutant. It is not only a pollutant in itself, but a carrier of animal wastes and chemical pollutants. Examples of the enormity of the sediment problem are cited. Nonfarm sources of sediment are a serious and growing problem. The fight against soil erosion has been headed by more than 3000 local soil and water conservation districts in the United States. A Conservation Needs Inventory indicates that 63% of all privately owned land (cropland, pasture, range, forest, other) needs some type of conservation treatment. Examples of the effectiveness of conservation treatment. Examples of the effectiveness of conservation measures are given. Continuing research and cooperation is needed between agencies and the general public in the resource conservation area. (See also W71-09752) (White-Iowa State)

SURFACE TEMPERATURE GRADIENTS OBSERVED IN MARINE AREAS RECEIVING WARM WATER DISCHARGES,
Bureau of Sport Fisheries and Wildlife, Tiburon, Calif. Tiburon Marine Lab.
James L. Squire, Jr.
Bureau of Sport Fisheries and Wildlife Technical Paper No. 11, January, 1967, 8 p., 6 fig., 2 tab., 6 ref.

Descriptors: *Thermal pollution, *Cooling water, Remote sensing, Outlets, Beaches, Fish, Water pollution sources.
Identifiers: Surface temperature, Coastal water.

Four outfall areas of steam electric generating plants in southern California were surveyed twice in early 1963. Equipment used for the survey was an infrared radiometer, a stripchart recorder, and associated power supply, mounted in a 4-place aircraft. During the first survey, the total cooling water output from the plants was 1.236 million gallons per minute heated 12.5F to 22F above intake temperatures at the plant sites. During the second survey, output was 1,187,400 gpm, heated 19F to 21F above intake temperatures. The four outfall areas surveyed were Redondo Beach, Alamitos, Huntington Beach and Carlsbad-Encina. Surface temperature increases above ambient on the two surveys were 4.2 and 4.0 for Redondo Beach, 17.0 and 20.0 for Alamitos, 7.2 and 6.5 for Huntington Beach and 8.0 and 4.0 for Carlsbad-Encina. Since observations were of surface gradients, the extent of mixing at depth was not determined. It is conceivable that large volumes discharge in the surf zone could impede the migration of such fish as drums (Scianidae) and surf perches (Embiotocidae). On the other hand, warm discharges are known to occasionally attract marine game species such as bonito (Sarda Chiliensis) and barracuda (Sphyraena Argentea). (Upadhyaya-Vanderbilt)

FOSSIL FUELS AS A SOURCE OF MERCURY POLLUTION,
Miami Univ., Fla. Rosenstiel School of Marine and Atmospheric Sciences.
Oiva I. Joensuu.
Science, Vol. 172, June 4, 1971, p. 1027-1028, 1 tab., 11 ref.

Descriptors: Environment, Leaching, Fungicides, Water pollution sources.
Identifiers: Mercury pollution, *Fossil fuels, *Mercury.

The buildup of mercury in the biomass is a recent phenomenon. A large part of the mercury found in the environment is apparently derived from industrially produced mercury, (about 10,000 tons per year) most of which is eventually discarded in waste streams. Amounts used as fungicides in treatment of grain seeds are much too small to explain high mercury contents in wildlife except in grain eating birds. To obtain an estimate of amount of mercury in coal, 36 American coals were analyzed by means of a mercury vapor detector. The average of the results (3.3 ppm) cannot be applied to total coal production. Applying a conservative estimate of 1 ppm, it is concluded that 3000 tons of mercury per year is released from the yearly production of 2 billion tons of coal. An upper limit of 230 tons per year for leached mercury by weathering is obtained by comparison with corresponding figures for sodium. (Upadhyaya-Vanderbilt)

MERCURY IN THE AIR.
Committee for Environmental Information.

Environment, Vol. 13, No. 4, p. 24-33, May, 1971, 4 fig., 1 table, 9 ref.

Descriptors: *Heavy metals, *Air pollution, *Pollutant identification, *On-site tests, Incineration, Powerplants, Industrial plants, Spectrometers, Water pollution sources.
Identifiers: *Mercury, *Air emissions, *Concentration levels, *Annual output, Mercury vapors.

A recent airborne survey conducted by the Committee for Environmental Information revealed that the annual mercury vapor discharge from some coal burning powerplants, municipal incinerators and several industrial plants may range from 100-5400 pounds per year at individual sites. The estimated annual rate of mercury vapor discharge from only 12 locations in Missouri and Illinois exceeds the rate of mercury discharge into waterways by the nation's 50 major mercury polluters. Measurements were made with the Barringer Airborne Mercury Spectrometer, from a helicpoter. Obtained concentration ranges and estimated rates of output from some 15 powerplants, 4 incinerators and 8 industrial plants are compiled, followed by a brief discussion of possible sources of mercury. It is pointed out that the study was made in winter, when vapor readings would be lowest. (Oleszkiewicz-Vanderbilt)

MERCURY IN THE ENVIRONMENT,
Terri Aaronson.
Environment, Vol. 13, No. 4, p. 16-23, 4 fig.

Descriptors: *Heavy metals, *Public health, *Environmental effects, *Food chains, Air pollution, Water pollution sources, Industrial plants, Standards, Jurisdiction, Circulation, Path of pollutants, Human diseases, Agricultural chemicals, Foods, Toxicity.
Identifiers: *Mercury, *Methyl mercury, *Maximum Permissible Level, Intake levels, Emissions, Symposium summary.

A resume of the symposium on 'Mercury in Man's Environment' held by the Royal Society of Canada in Ottawa on February 15 and 16 is presented. Various topics have been discussed during that meeting, among others: (1) present and past sources of mercury in the environment agriculture accounts for about 4% of the total mercury consumed annually in the USA; thermometers broken in homes and hospitals in Canada annually release to the environment 14,000 pounds of elemental mercury; (2) levels of mercury contamination - food chains; (3) biological and medical aspects of mercury pollution, and (4) maximum permissible levels of mercury contamination of food-stuffs. The author concludes that despite the hundred-year history of mercury pollution, its sources are only now being traced. Power plants, incinerators, chemical plants, and perhaps hospitals and laboratories, are major modern sources of the 23 million pounds of mercury released worldwide each year. (Oleszkiewicz-Vanderbilt)

TWO LAYER STRATIFIED FLOW IN CONVERGING SECTION,
Water Economics Research Inst., Warsaw (Poland).
W. Poplawski.
In Polish with English summary. Archiwum Hydrotechniki, Vol. XVII, No. 3, p. 365-378, 1970. 8 fig., 7 ref.

Descriptors: *Laboratory tests, *Mixing, *Stratified flow, *Hydraulic models, *Froude number, *Density stratification, *Mathematical models, Fluid friction, Velocity, Distribution pattern, Outlet works, Hydraulic conduits, Heated water, Waste water disposal.
Identifiers: *Densimetric Froude number, *Fluid motion equations, Bresse's equation, TVA Engineering Laboratory.

Laboratory studies are presented on determination of the minimum densimetric Froude number, necessary to enforce complete mixing of wastewater introduced to river with a density different from that of the ambient fluid. The studies, conducted at the TVA Engineering Laboratory at Norris, resulted in the following conclusions: (1) The construction of an approximate mathematical model on the basis of a set of fluid motion equations probably yields better results than attempts at purely empirical correlations. (2) Rapid mixing cannot be expected in rivers where the densimetric Froude number (F') is equal to 1.0. Outlet construction should create sufficient velocity of discharge that the minimum F' — 5 be obtained and in the case of deep rivers this number should be even higher. (Oleszkiewicz-Vanderbilt)

NOTE: FORMATION OF METHYL MERCURY FROM PURE MERCURIC SULPHITE IN AEROBIC ORGANIC SEDIMENT,
Swedish Water and Air Pollution Lab., Stockholm (Sweden).
Torbjorn Fagerstrom, and Arne Jernelov.
Water Research, Pergamon Press, Vol. 5, No. 3, p. 121-122, 1971, 3 ref.

Descriptors: *Heavy metals, *Sediments, *Aerobic methylation, Laboratory tests, Toxicity, Aquaria, Water pollution control.
Identifiers: *Methyl mercury formation, *Biological methylation, *Mercuric sulphide, Mercury.

The formation of methyl mercury in aerobic organic sediments has been studied. It has been shown in the laboratory that even the form of pure mercuric sulphite is available for biological methylation. The speed of the methylation process, however, is considerably lower than when mercury is present as inorganic divalent mercury. The amount of methyl mercury formed from added mercuric sulphide corresponds to the amount formed from inorganic divalent mercury at a concentration of .0010 of that for mercuric sulphide. MERCURY IN THE ENVIRONMENT,
L. J. Goldwater.
Scientific American, Vol. 224, No. 5, p 15-21, May, 1971, 8 fig.

Descriptors: *Heavy metals, *Toxicity, *Public health, Environmental effects, Food chains, Industrial production, Circulation, Epidemiology, Water pollution, Air pollution, Solid wastes, Chromosomes.
Identifiers: *Mercury, *Methyl mercury, Mercury demand, Mercury industry, Cinnabar deposits, Aquatic life, Lithosphere, Biosphere.

Review of the present state of affairs regarding mercury in the environment suggests that the best way to deal with the problem is to apply the techniques of epidemiology, preventive medicine, public health and industrial hygiene that have been effective in meeting hazards in the past. A system should be set up for frequent monitoring of the environment for the detection of significant increases in mercury contamination. Distribution of various forms of mercury is presented followed by the discussion of the mercury cycle in the lithosphere, hydrosphere, atmosphere and biosphere, as well as

conversion of the metal into methyl mercury in the aquatic food chain and in the sediments. Industries responsible for direct and indirect discharge of mercury into the environment are outlined. Atmospheric mercury levels measured at San Francisco (including some above 0.02 micrograms/cubic meter) and concentration levels found in food are presented; some biological effects of ingestion are also discussed. A need is noted for a better understanding of what should be considered a toxic level of mercury in the human body. (Oleszkiewicz-Vanderbilt)
W71-09787

A WATER RESOURCE-WATER SUPPLY STUDY OF THE POTOMAC ESTUARY,
Environmental Protection Agency, Annapolis, Md. Chesapeake Technical Support Lab.
Norbert A. Jaworski, Leo J. Clark, and Kenneth D. Feigner.
Environmental Protection Agency, Water Quality Office, Technical Report 35, April 1971, 263 p, 39 tab.

Descriptors: *Estuaries, *Water quality, *Water resources development, *Water supply, Waste water, Runoff, Dissolved oxygen, Algae, Nutrients, Bacteria, Viruses, Heavy metals, Human population, Waste water treatment, Water quality control.
Identifiers: Potomac Estuary.

A detailed investigation of the water quality and water resources of the Potomac Estuary was conducted by the Chesapeake Technical Support Laboratory. Included in the study were an evaluation of pollution sources including nutrients; the development of mathematical models to predict pollutant effects on water quality; the projection of water supply needs and wastewater loadings; an evaluation as a potential water supply source; the determination of the maximum pound loadings by zone for certain pollutants under different flow conditions; alternative waste treatment plans and cost analysis of wastewater treatment. UTILITY OF RADIOISOTOPE METHODOLOGY IN ESTUARY POLLUTION CONTROL STUDIES. PART I. EVALUATION OF THE USE OF RADIOISOTOPES AND FLUORESCENT DYES FOR DETERMINING LONGITUDINAL DISPERSION COEFFICIENT IN ESTUARIES.
Quirk, Lawler and Matusky Engineers, New York.

Available from the Clearinghouse for Federal, Scientific and Technical Information, Bureau of Standards, U.S. Dept. of Commerce, Springfield, Virginia, $3.06. Atomic Energy Commission Report NYO 39611, August 1969, 197 p, 44 fig, 27 tab, 73 ref.

Descriptors: *Estuaries, *Water pollution control, *Radioisotopes, *Fluorescence, *Dye releases, *Dispersion, Tracers, On-site investigations.

The relative merits of using radiotracers and fluorescent dyes for determining longitudinal dispersion coefficients in estuaries were evaluated. Areas where radiotracers would provide a feasible means of estimating the mass transport parameter were delineated. Evaluation of more than 100 radioisotopes and fluorescent dyes showed only eighteen suitable as field tracers. The eighteen tracers were compared on the basis of selected mathematical models. Analysis showed that there are advantages and limitations to both groups of tracers. Radiotracers seem to meet the technical requirements of an ideal tracer better than other materials. However, non-technical aspects such as approval and licensing by various governmental agencies, adverse public reaction, handling, safety and personnel can be problems. These aspects are important advantages of using dyes as field tracers. (Ensign-PAI)

RUNOFF OF DEICING SALT: EFFECT ON IRONDEQUOIT BAY, ROCHESTER, NEW YORK,
Rochester Univ., New York. Dept. of Geological Sciences.
Robert C. Bubeck, William H. Diment, Bruce L. Deck, Alton L. Baldwin, and Stewart D. Lipton.
Science, Vol 172, No. 3988, p 1128-1132, June 11, 1971. 5 p, 4 fig, 13 ref. NSF Grant GA-11146, NOAA SEA Grant GH-106.

Descriptors: *Water pollution effects, *Salinity, *Lake Ontario, *New York, *Snow removal, Deicers, Melting, Salts, Chlorides, Density, Density stratification, Thermal stratification, Turnovers, Mixing.
Identifiers: *Irondequoit Bay (N.Y.).

Salt used for deicing the streets near Rochester, New York, has increased the chloride concentration in Irondequoit Bay at least fivefold during the past two decades. During the winter of 1969-70 the quantity and salinity of the dense runoff that accumulated on the bottom of the bay was sufficient to prevent complete vertical mixing of the bay during the spring. Comparison with 1939 conditions indicates that the period of summer stratification has been prolonged a month by the density gradient imposed by the salt runoff. (Knapp-USGS)

CONVOLUTION APPROACH TO THE SOLUTION FOR THE DISSOLVED OXYGEN BALANCE EQUATION IN A STREAM,
Geological Survey, Fort Collins, Colo.
James P. Bennett.
Water Resources Research, Vol 7, No 3, p 580-590, June 1971. 11p, 4 fig, 17 ref.

Descriptors: *Water pollution control, *Waste assimilative capacity, *Dissolved oxygen, *Biochemical oxygen demand, *Oxygen demand, Mathematical models, Water pollution effects, Path of pollutants, Oxygen sag, Numerical analysis, Self-purification.
Identifiers: *Oxygen balance (Streams).

In terms of its response to biochemical oxygen demand (BOD) and dissolved oxygen (DO) inputs, a natural waterway may be treated as a system governed by the BOD and DO balance differential equations. Using the response of the DO balance differential equation to impulse inputs of DO and BOD, one can compute by convolution the response of the system to arbitrary BOD and DO inputs. The convolution technique requires numerical integration, but it is not a numerical solution to a differential equation; it therefore avoids the stability problems inherent in such solutions. The convolution technique permits consideration of longitudinal dispersion in systems that have time varying DO and BOD inputs, a situation that could previously be investigated only by numerical solutions to the basic differential equations. Examples show the capability of the convolution tehcnique to reproduce field data and to match previously developed analytical and numerical techniques. (Knapp-USGS)

INFLUENCE OF THE PHYSIOCOCHEMICAL FORM OF RUTHENIUM ON CONTAMINATION OF MARINE ORGANISMS, (In French),
Departement de la Protection Sanitaire, Cherbourg (France). Section de Radio-ecologie.
Pierre Guegueniat, Pierre Bovard, and Jacques Ancellin.
Comptes Rendus, Series D, Vol 268, Feb 10, 1969, p 976-979.

Descriptors: *Marine animals, *Marine plants, Radioisotopes, Physicochemical properties, Anion adsorption, Colloids, Aquaria, Absorption, Water pollution effects, Cation exchange, Cation adsorption, Hydrolysis, Marine algae, Invertebrates, Nuclear wastes, Water pollution sources.
Identifiers: *Ruthenium radioisotopes.

The derivatives of ruthenium nitrosyls from effluents of fuel reprocessing plants were found in various physicochemical forms in sea water - as precipitates, in solution, or in colloidal form. The form in which the ruthenium was present depended upon the amounts of other suspended material in the sea water. Experiments in aquaria showed that ruthenium present in precipitates caused more contamination of marine algae and invertebrates as compared with soluble (cationic) ruthenium. (Bopp-NSIC)

STUDY OF THE DISTRIBUTION OF RUTHENIUM IN AN ECOLOGICAL POND USING NEUTRON ACTIVATION ANALYSIS, (In French),
Centre d'Etude de l'Energie Nucleaire, Grenoble (France). Laboratoire de Biologie Vegetale.
M. Neuburger, and A. Fourcy.
International Journal of Applied Radiation and Isotopes, Vol 20, p 641-651 (1969). 9 fig, 7 tab, 7 ref.

Descriptors: *Lakes, *Neutron activation analysis, *Nuclear wastes, Aquatic plants, Amphibious plants, Lake soils, Sediments, Water pollution sources, Pollutant identification.
Identifiers: *Ruthenium radioisotopes.

Ruthenium is one of the components of radioactive wastes issued from nuclear experimentation. As ruthenium radioisotopes have the same biological behaviour as stable ruthenium, it is suggested to study the partition of a low intake of non-radioactive ruthenium in an ecological pond which is initially nearly free of natural ruthenium. For this purpose, water, sediments, aquatic and semiaquatic plants are periodically taken off and analyzed according to an original technique, using neutron activation analysis. (Bopp-NSIC)

A SUMMARY OF WATER POLLUTION PROBLEMS IN THE LAKE MICHIGAN BASIN,
Toltz, King, Duvall, Anderson and Associates, Inc., St. Paul, Minn.
Harry Cleveland Grounds.
In: Proceedings, Tenth Conference on Great Lakes Research, Ann Arbor, Braun-Brumfield, Inc., 1967, p 420-426.

Descriptors: *Water pollution sources, *Water quality, Water pollution control, Industrial wastes, Population, Government, Rivers, Watersheds, Basins, Costs, Financing, Sewerage, Waste treatment, Taxes.
Identifiers: *Lake Michigan, *Waste load, Pulp and paper industry, Pollution zones.

The water pollution problems in the Lake Michigan watershed zones are surveyed, including the waters of the Calumet region in Illinois and Indiana, the Green Bay are in Wisconsin and Michigan, and parts of the St. Joseph, Grand, Kalamazoo and Muskegon Rivers in Indiana and Michigan. The major source of pollution of these waters is the industrial wastes from industries supporting the watershed's 5.5 million population. These include pulp and paper manufacturers, petro-chemical processes, steel manufacture, and food processing. Wastes from these industries exceed the basin population in terms of population equivalents, boosting the waste load to approximately equal the raw wastes of some 6 million persons. The efficacy of various water pollution control agencies, enforcement agencies, and pollution measures is cited and indications are made that such agencies are working with local government and industry to improve present water quality and insure its protection for future use. (Murphy-Rutgers)

5C. Effects of Pollution

THERMAL POLLUTION IN THE MARINE ENVIRONMENT,
New York State Dept. of Conservation, Albany. Div. of Marine and Coastal Resources.
Albert C. Jensen.
The Conservationist, Vol 25, No 2, p 8-13, Oct-Nov 1970. 5 fig.

Descriptors: *Thermal pollution, Commercial fishing, Project planning, Ecology.
Identifiers: *New York State's Marine District, Hudson River, Long Island Sound.

If adequate ecological planning is not undertaken before the construction of a power plant, the damage to the fishing industry from thermal pollution can be substantial. Although, at the present time, eighty percent of New York State's Marine Districts thermal pollution comes from electric power plants, the plans for construction of massive nuclear power plants could have more serious consequences because they are planned for areas where the pollution level is still low. (Holmes-Rutgers)

STUDY OF TRITIUM HAZARDS,
Commissariat a l'Energie Atomique, Fontenay-aux-Roses (France). Centre D'Etudes Nucleaires.
B. Vaubert, and R. Bittel.
Availability: NTIS. CEA-BIB-182, EUR-4522F, Sep 1970. 47 p.

Descriptors: *Tritium, *Bibliographies, *Radiation, *Radioisotopes, *Hydrogen, Oxygen, *Water, *Gases, Chemical reactions, Hazards, Radiochemical analysis, Transfer, Environment, Meteoric water, Aquifers, Absorption, Biological communities, Inhalation, Environmental effects, Biological properties.

In this bibliography the following points were considered: nuclear characteristics, tritium production processes and resulting potential hazards; tritium behavior towards hydrogen and several hydrogenated compounds; detection and radiochemical determination; environmental transfers, with emphasis on tritium behavior in the presence of atmospheric water and in various aquifer systems; some biological considerations of absorption, inhalation, and dosimetry; and radiobiology in order to characterize effects caused by the nuclear characteristics of tritium. W71-09493

ROLE OF FRESHWATER PLANTS IN THE COPRECIPITATION OF STRONTIUM-90 WITH CALCIUM CARBONATES (IN RUSSIAN),
N. V. Kulikov, S. A. Lyubimova, and N. A. Timofeeva.
Ekologiya, No 4, p 55-8, 1970. 4 tab, 12 ref.

Descriptors: *Strontium radioisotopes, *Cyanophyta, *Chlorophyta, *Adsorption, Calcium carbonate, Chemical precipitation, Absorption, Surface.

Strontium-90 was present in a calcium carbonate precipitate on freshwater plant surfaces, both in aquariums and in natural habitats. About one order of magnitude more strontium was present in the precipitate than within plant tissures. The discrimination coefficient, (strontium-90/calcium in the precipitate)/ (strontium-90/calcium in water) was independent of the calcium concentration in water and the value between different plants varied from 0.34 to 1.25. Formation of the precipitate probably occurs through a reaction of calcium and strontium cholorides with sodium carbonate which is induced by metabolic processes. (Bopp-ORNL)

COLUMBIA RIVER STUDIES, ANNUAL PROGRESS REPORT, 1969-1970,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T-1-2, Jun 22, 1970. 30 p, 2 app.

Descriptors: *Ecology, *Ecosystem, *Columbia River, *Temperature, *Radioactivity effects, *Oysters, *Mussels, *Phytoplankton, Absorption, Iron, Life cycles, Zinc, Environment, Monitoring.

Six research programs were completed or were in progress at the radiation ecology laboratory during the 1969 to 1970 reporting period. These included effects of temperature and ionizing radiation on the larvae of the Pacific oyster; effects of shock temperature and ionizing radiation on phytoplankton; uptake of Fe-55 by mussels from the Washington coast (1962 to 1969); zinc biological half-life for oysters in a natural environment; dose measurements with thermoluminescent dosimeters; and monitoring of mussels from Washington waters for Zn-65. Results from each phase of the research program are briefly discussed. (See also W71-09505 thru W71-09509) (Houser-NSIC)
W71-09504

COLUMBIA RIVER STUDIES 1969-1970, UPTAKE OF Fe-55 BY MUSSELS FROM THE WASHINGTON COAST, 1962-1969,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T-1-2, June 22, 1970, p 2-5.

Descriptors: *Ecology, *Ecosystems, *Absorption, *Aquatic life, *Biology, *Columbia River, *Mussels, *Fallout, *Radioactivity effects, Animals, Animal population, Iron, Life cycles.

Fe-55 in fallout and mussels are related. The pattern of Zn-65 in mussels is not unlike that in lichen and moss from northern Sweden for the years 1962-1966, although the actual values for mussels are about 1/10 the lichen and moss values. Mussels probably take up iron rapidly, but the biological half-life is greater than the physical half-life of Fe-55. (See also W71-09504) (Houser-NSIC)
W71-09505

COLUMBIA RIVER STUDIES 1969-1970, ZINC BIOLOGICAL HALF-LIFE FOR OYSTERS IN A NATURAL ENVIRONMENT,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T1-2, June 22, 1970, p 5-9.

Descriptors: *Columbia River, *Ecology, *Ecosystems, *Absorption, *Oysters, *Zinc radioisotopes, Life-cycles, Biology, Environment, Environmental effects, Radioactivity effects.

The biological half-life for ZN-65 may be as short as 100 days for the summer months (perhaps for a spawning oyster) or as long as 1,350 days. Average values for 9 oysters for the first 15 months of the experiment were 158 days for effective half-life and 538 days for biological half-life. (See also W71-09504) (Houser-NSIC)
W71-09506

COLUMBIA RIVER STUDIES 1969-1970, MONITORING OF MUSSELS FROM WASHINGTON WATERS FOR ZINC-65,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T-1-2, June 22, 1970, p 10-13.

Descriptors: *Nuclear power plants, *Zinc radioisotopes, *Mussels, *Columbia River, *Harbors, *Radioactivity effect, Monitoring, Sampling, Aquatic animals, Ecology, Water pollution, Water pollution effects, Water pollution sources.

The primary objective is to relate the output of Zn-65 from the Hanford reactors with the ZN-65 values in mussels from Washington waters. The samples were collected at the mouth of the Columbia River, along the ocean coast and the Straits of Juan de Fuca and in Puget Sound. A secondary objective is to relate the ZN-65 value in mussels with distance from the mouth of the Columbia River. Of the eight original production reactors at Hanford, seven have been shut down between January 1965 and February 1970. As a consequence, the amount of Zn-65 in mussels has decreased, with the most significant decrease occurring near the mouth of the Columbia River, where the concentration of Zn-65 is the greatest. (See also W71-09504) (Houser-NSIC)
W71-09507

COLUMBIA RIVER STUDIES 1969-1970, EFFECTS OF TEMPERATURE AND IONIZING RADIATION ON THE LARVAE OF THE PACIFIC OYSTER,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T-1-2, June 22, 1970, p 1. App A.

Descriptors: *Columbia River, *Oysters, *Temperature, *Radioactivity effects, *Life cycles, *Ecosystems, *Tritium, *Zinc radioisotopes, Aquatic animals, Biology, Absorption, Water pollution, Thermal pollution, Water pollution effects, Water pollution sources.

The experiments showed that temperature effects occurred between 24C and 28C and that radiation effects occurred at H-3 and Zn-65 concentrations of 10 3 Ci/liter. However, no effects of the interaction between temperature and radiation were observed and, the life stage at time of irradiation was not a factor in producing abnormal larvae. A detailed discussion of these experiments is given. (See also W71-09504) (Houser-NSIC)
W71-09508

COLUMBIA RIVER STUDIES 1969-1970, EFFECTS OF SHOCK TEMPERATURE AND IONIZING RADIATION ON PHYTOPLANKTON,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Availability: NTIS. RLO-2225-T-1-2, June 22, 1970, p 2, App B.

Descriptors: *Radioactivity effect, *Thermal pollution, *Water pollution, *Water pollution effect, Water pollution sources, *Phytoplankton, Aquatic fungi, Columbia River, Ecology, Ecosystem.

The objective was to determine the effects of short time temperature changes, of ionizing radiation, and of temperature changes plus ionizing radiation on phytoplankton organisms as measured by their ability to use carbon in the photosynthetic process. The experiments were designed to measure primary productivity in water used as the secondary coolant for nuclear reactors. Although the amount of radionuclides in the discharge water will be very small, the radiation phase of the experiment will be of academic interest. The temperature effects on primary production are of considerable ecological significance since primary production is the foundation for all higher trophic levels. (See also W71-09504) (Houser-NSIC)
W71-09509

EVALUATION OF RADIOLOGICAL CONDITIONS IN THE VICINITY OF HANFORD FOR 1967.
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.

Availability: NTIS. BNWL-983, March 1969. 87 p, 30 fig, 11 tab, 17 ref, and BNWL-983 Feb 1969, (App.). 139 p.

Descriptors: *Waste water disposal, *Effluents, *Water pollution sources, *Waste water (Pollution), Water pollution control, Monitoring, Environment, Sedimentation, Columbia River, Population, Diets.

Controlled releases of a variety of low-level radioactive wastes are made to the Columbia River, to the ground, and to the atmosphere. The major source of low-level wastes released to the environment in 1967 continued to be reactor cooling water discharged to the Columbia River. Evaluation of the combined offsite effects of all radioactive waste releases during 1967 showed that concentrations of radionuclides in the environs and radiation doses received by nearby population groups were well within accepted limits. Estimates were made of the whole body, gastrointestinal tract, and thyroid doses and the annual intake of bone-seeking nuclides. Population groups considered included Maximum Individuals and typical Richland residents, and for the first time Richland residents. Diet information accumulated from plant employees permitted calculation of both average dose values and dose distribution for Richland residents. The only population dose estimate exceeding one-tenth of the appropriate limit was 12% of the Maximum Permissible Rate of Intake to the bone of a hypothetical Maximum Individual, with P-32 contributing 99% of the estimated dose and Columbia River fish the major source of intake. IMPOUNDMENT EFFECTS ON WATER QUALITY AS REFLECTED IN PARASITISM OF RESERVOIR BASSES,
Arkansas Univ., Fayetteville. Water Resources Research Center.
David A. Becker.
Available from the National Technical Information Service as PB-200 826, $3.00 in paper copy, $0.95 in microfiche. Technical Completion Report, Water Resources Research Center, 1971, 10 p, 13 ref. OWRR Project A-009-ARK (5).

Descriptors: *Fish parasites, *Bass, Pre-impoundment, Early impoundment, Dispersion, Fluctuation, Aging, Growth rates, Sport fish, Water pollution effects, *Impoundments, Fish, *Parasitism.
Identifiers: Black bass, Helminth parasites, Copepod parasites.

Field investigations involved live collections of the black basses Micropterus dolomieui Lacepede, M. punctulatus (Rafinesque), and M. salmoides (Lacepede). Basses were examined in the laboratory for helminth and copepod parasites in an effort to follow the quantitative and qualitative dispersions and fluctuations of these parasites as the water quality is effected by the water level fluctuations from a river to a reservoir environment. Standard and total length, weight, and scale samples were obtained to ascertain the effect of parasitism on the aging and growth rates of basses which may help explain why sport fishing declines after several years in recently impounded reservoirs effecting the recreational economy of the municipalities surrounding reservoirs. Parasitism were related to the whole food chain in an attempt to establish another parameter for water quality. The comparison of pre- and post-impoundment data was stressed. Results were also compared with other studies involving newly impounded reservoirs. (Babcock-Arkansas)

PHYTOPLANKTON DYNAMICS AND PRODUCTIVITY IN A SHALLOW, HIGHLY EUTROPHIC LAKE: WITH SPECIAL REFERENCE TO MELOSIRA AMBIGUA (GRUN.) O. MULL. AND M. GRANULATA (EHR.) RALFS,
Wisconsin Univ., Madison. Water Resources Center.
William E. Sloey.
Doctor of Philosophy Thesis, Dept of Botany, University of Wisconsin-Milwaukee, 1969, 162 p, 22 fig, 6 tab, 126 ref. OWRR Project A-011-WIS (2).

Descriptors: *Phytoplankton, *Diatoms, *Turbulence, *Aquatic plants, *Water temperature, *Dissolved oxygen, *Dissolved solids, *Lake, *Water chemistry, Wisconsin, *Eutrophication.
Identifiers: *Population dynamics, *Melosira granulata (Ehr) Ralfs, *M ambigua (Grun) O Mull, Thermal stability, Secchi disc transparencies, Nitrate variation, Phosphate variation, Carbon-14 productivity, Stephanodiscus niagarae Ehr, S Hantzschii Grun, Anabaena, Microcystis, Aphanizomenon.

The phytoplankton population dynamics, carbon-14 primary productivity and certain physicochemical properties of the shallow and highly eutrophic Lake Butte des Morts, Wisconsin was studied in 1966-69. Two co-dominant summer diatoms, Melosira granulata (Ehr.) Ralfs and M. ambigua (Grun.) O. Mull., widely recognized as indicators of eutrophy, were emphasized in the study. Periodicities of other planktonic members of the genus Melosira have been shown to be related primarily to water turbulence, and perennation is

due to survival as vegetative cells in the bottom sediments during periods of thermal stability. Lake Butte des Morts is a portion of the larger Winnebago pool and has an area of 37.79 square kilometers, a mean depth of 1.42 meters, and a theoretical retention time of only 2 to 14 days. The trophic state of the lake is comparable to western Lake Erie and the lake is presently undergoing a significant loss of aquatic macrophytes and turbidity is increasing. Thermal stability was found to be temporary during open water periods and occurred only during calm conditions. The water quality characteristics of the lake were evaluated in terms of water temperature, dissolved oxygen, Secchi disc transparencies, dissolved solids, nitrate, and phosphate variation during seasonal changes. Both Melosira ambigua and M. granulata were found alive in the bottom sediments to depths of 7 centimeters, while few other forms survived at any depth. Temperature is the dominant factor apparently regulating population growth rates of these two species and data from the study and from the literature were collected to characterize these species.
W71-09561

FALL CHINOOK SALMONS SPAWNING IN THE COLUMBIA RIVER NEAR HANFORD, 1947-1969,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
D. G. Watson.
Available from the National Technical Information Service as BNWL-1515, $3.00 in paper copy, $0.95 in microfiche. Betelle Northwest Laboratories report BNWL-1515, Oct 1970. 45 p.

Descriptors: *Thermal pollution, *Fish behavior, *Chinook salmon, *Ecosystems, Columbia river.
Identifiers: *Heated effluents, *Osteichthyes.

There was no evident relationship between the operation of the Hanford reactors and the numbers of fish spawning in the Hanford reach of the river. Recent increases in numbers of fall chinook spawners seemed more closely associated with the construction of dams downstream and immediately upstream from Hanford, and the probably displacement of fish from these areas. Water temperatures were less than 15LC during the peak of spawning, well within the upper tolerance limits for this species.
W71-09573

TEMPERATURE, TIMING, AND SEAWARD MIGRATION OF JUVENILE CHINOOK SALMON FROM THE CENTRAL COLUMBIA RIVER,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
C. D. Becker.
Available from the National Technical Information Service as BNWL-1472, $3.00 in paper copy, $0.95 in microfiche. Batelle Northwest Laboratories report BNWL-1472, Jul 1970. 21 p.

Descriptors: *Thermal pollution, *Fish behavior, *Chinook salmon, Columbia River.
Identifiers: *Hanford production reactors, *Heated effluents, *Osteichthyes.

A sizeable population of adult chinook salmon now spawns each fall in the free-flowing Hanford environs of the central Columbia River. This population has acquired significance because other vital spawning areas in the mainstem Columbia have been inundated by hydroelectric development. Studies conducted in 1969 show that the progeny of the Hanford population migrates seaward from April to July in the ancient pattern that correlates with favorable water temperatures and high discharge volumes. In contrast, the passage of juvenile chinooks that now issue from upriver reaches is known to be delayed until July and August when temperatures and dishcharge volumes are less favorable. Temperatures in the central Columbia are modified by discharges of heated effluent from plutonium production reactors at Hanford, in addition to largely seasonal changes in river flow, cooling or warming by the upriver reservoir complex, and summer heat input from the atmosphere. In 1968 and 1969, mean weekly water temperatures peaked in late July, August, and early September with maximum daily temperatures briefly reaching 19.1 and 19.7C, respctively, at Priest Rapids and 19.7 and 20.6C at Richland. The relationship of ambient temperatures and river discharges to the natural and delayed migration of juvenile chinooks through the Hanford area is evaluated. Maximum temperatures in the central Columbia seldom exceed 22C and have not been recorded as approaching 25.1C, the apparent upper incipient lethal limit for juvenile chinooks. Although peak summer temperatures (above 20C) may be suboptimum for the survival of young salmon, such conditions probably existed long before the advent of modern man. Present peak temperatures do not appear to be directly lethal even with increments of heat from reactor effluent. Potentially adverse thermal effects from reactor operation would most likely appear at subacute levels and resist casual detection. This assumes that a slight increase in excess of the annual temperature cycle does not greatly intensify other existing environmental hazards.
W71-09574

THE ROLE OF PRIMARY PRODUCTION IN SOLVING PROBLEMS OF HYDROBIOLOGICAL PROCESSES AND THE MEANS OF CONTROLLING THEM,
Naval Oceanographic Office, Washington, D.C.
V. I. Zhadin.
Available from the National Technical Information Service as AD-720 183, $3.00 in paper copy, $0.95 in microfiche. Naval Oceanographic Office Translation 199, 1963; trans-from: Pervichnaya Produkstsiya morey i vnutrennikn rod.

Descriptors: *Water pollution, *Plankton, *Fouling, Sanitary engineering.
Identifiers: Biological contamination, Hydraulic systems, USSR, *Primary biological productivity.

The paper discusses the effect of primary production and biological contamination of water basins, which causes pollution of water and fouling on vessels, water pipes and hydraulic structures. The problems arising from the phenomena and the measures aimed at lessening or eliminating their negative effect on national economy and sanitary conditions are singled out, indicating the need for special organizations and institutes that would contribute to the solution of the complex problems.

PHYSIOLOGICAL ECOLOGY OF SELECTED POLYCHAETOUS ANNELIDS EXPOSED TO DIFFERENT TEMPERATURE, SALINITY AND DISSOLVED OXYGEN COMBINATIONS,
Maine Univ., Orono.
Thomas L. Richards.
Ph.D. Thesis, August 1969, 170 p, 42 fig, 21 tab, 176 ref. NSF Grant GB-4892 and Office of Water Resources Research Project No A-011 ME (2).

Descriptors: *Annelids, *Physiological ecology, *Water temperature, *Salinity, *Dissolved oxygen, *Biochemical oxygen demand, Worms, Environmental effects, Thermal pollution, Sea water, Salt tolerance, Stress, Effective stress, Invertebrates, Resistance.
Identifiers: *Polychaetes, Nereidae, Spionidae, Survival.

Survival of adult and larval polychaetes belonging to the families Nereidae and Spionidae in reduced dissolved oxygen concentrations was temperature and salinity dependent, and independent of the life history stages. Species adapted to estuarine conditions tolerate wide fluctuations in temperature, salinity and dissolved oxygen, while species found in open coast areas, where environmental changes are not so great, survived only moderate changes. Nereids and spionids would make good assay organisms. (Katz-Washington)
W71-09658

TEMPERATURE TOLERANCE OF YOUNG-OF-THE-YEAR CISCO, COREGONUS ARTEDII,
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
Thomas A. Edsall, and Peter J. Colby.
Transactions of the American Fisheries Society, Vol 99, No 3, p 526-531, July 1970. 4 fig, 1 tab, 14 ref.

Descriptors: *Water temperature, *Lethal limit, *Physiological ecology, *Cold resistance, *Heat resistance, *Cisco, *Environmental effects, Bioassay, Temperature, Fish physiology, Aquatic environment, Water quality, Water pollution effects, Fish diseases, Great Lakes, Growth stages.
Identifiers: *Coregonid fishes, Coregonidae, Natural mortality.

Young-of-the-year ciscoes (Coregonus artedii) acclimated to 2,5,10, 20 and 25C and tested for tolerance to high and low temperatures provide the first detailed description of the thermal tolerance for coregonids in North America. The upper ultimate lethal temperature of the young ciscoes was 26C (6C higher than the maximum sustained temperature tolerated at adult ciscoes in nature) and the ultimate lower lethal temperature approached 0C (near that commonly tolerated in nature by adult ciscoes). The temperature of 26C is slightly higher than the lowest ultimate upper lethal temperature recorded for North America freshwater fishes; however, published information on the depth distributions of fishes in the Great Lakes suggests that some of the other coregonids may be less tolerant of high temperatures than the ciscoes. (LeGore-Washington)
W71-09659

THE TOXICITY OF THE HYDROLYSIS AND BREAKDOWN PRODUCTS OF MALATHION TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS, RAFINESQUE),
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
Michael E. Bender.
Water Research, Vol 3, p 571-582, 1969. 4 fig, 2 tab, 14 ref. USPHS grant no ES-00016-02.

Descriptors: *Toxicity, *Organophosphorous pesticides, *Lethal limit, *Pesticide kinetics, *Pesticide residues, *Pesticide toxicity, Bioassay, Control, Toxins, Hydrolysis, Hydrogen ion concentration.
Identifiers: *Malathion, *Breakdown products, *Synergism, TLm, Pimephales sp.

Malathion undergoes hydrolysis in aqueous solutions; the products derived from the reaction are dependent upon the pH of the medium. It was the purpose of this investigation to evaluate the toxicity of the products of malathion hydrolysis in the fathead minnow, Pimephales promelas. The studies were conducted by toxicity bioassays of 96 hr duration and continuous exposure tests of 14 day duration. The results of the experiments demonstrated the following: (1) the basic hydrolysis product, diethyl fumarate, was more toxic than malathion to the test species; (2) a pronounced synergistic effect

was demonstrated between malathion and its two basic hydrolysis products; and (3) continuous exposure decreased the TLm concentration of malathion and its basic hydrolysis products. (LeGore-Washington)

ECHINODERMS: AN AUTORADIOGRAPHIC STUDY OF ASSIMILATION OF DISSOLVED ORGANIC MOLECULES,
Newcastle-uon-Tyne Univ. (England). Dept. of Zoology; and Newcastle-upon-Tyne Univ. (England). Dove Marine Lab.
A. R. Fontaine, and Fu-Shiang Chia.
Science, Vol 161, p 1153-1155, Sept 13, 1968. 2 tab, 8 ref.

Descriptors: *Absorption, *Physiological ecology, *Animal physiology, *Metabolism, *Organic compounds, Penetration, Aquatic animals, Biochemistry, Analytical techniques.
Identifiers: *Assimilation, *Echinodermata, Autoradiography, Cucumaria sp., Amphipholis sp., Sea cucumber, Starfish.

Autoradiographic techniques were utilized to examine assimilation of dissolved organic molecules by a holothurian (Cucumaria lactea) and an ophiuroid (Amphipholis squamata). Animals were immersed in experimental solutions for 3 hr and sampled at 0, 1, 3 and 7 days post-exposure. Labelled glycine and glucose remaining in the autoradiographs was apparently incorporated into synthesized macromolecules. Cells differ in their competence to metabolize specific nutrients, an indication that there are speciallized cellular responses to exogenous organic molecules. Embryonic ophiuroid tissues have an exceptional capacity for assimilation. (LeGore-Washington)
W71-09662

ECOLOGICAL MANAGEMENT PROBLEMS CAUSED BY HEATED WASTE WATER DISCHARGE INTO THE AQUATIC ENVIRONMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
John Cairns, Jr.
Water Resources Bulletin, Vol 6, No 6, p 868-878, November-December 1970, 4 fig, 22 ref.

Descriptors: *Water pollution effects, *Water pollution sources, *Water pollution treatment, *Water pollution control, *Cooling water, *Heated water, *Water temperature, *Electric powerplants, Environmental effects, Water quality, Aquatic environment, Temperature, Aquatic populations, Physiological ecology, Technology, Nuclear powerplants, Thermal powerplants, Stress.
Identifiers: *Thermal pollution, Energy production, Energy utilization, Biological stress.

Discharge of heated waste water may affect entire aquatic ecosystems and, if the temperature change is large, may destroy the capacity of the ecosystem to serve a variety of beneficial purposes. However, it is possible to discharge heated waste water in carefully controlled amounts without seriously degrading the aquatic ecosystem. There are four basic alternatives open to us regarding heated waste water: (1) placing all heated waste water in streams, lakes and oceans without regard to the effects, thus considering the environmental damage a necessary consequence of our increased power demand; (2) using, but not abusing, existing ecosystems; (3) finding alternative ways to dissipate or beneficially use waste heat; and (4) modifying ecosystems to fit the new temperature conditions. We have reached a stage of development in which the ecological portion of our life-support system is endangered by the expanding industrial portion. Optimal function and full beneficial use of both portions will be possible only if a variety of disciplines and diverse points of view can cooperate. Since wastes in amounts that are acceptable taken one at a time may be lethal collectively, environmental management should be on a regional basis. (LeGore-Washington)
W71-09664

PESTICIDE RESIDUES IN FISH ARE STAGGERING, HOWEVER, DDT CAN BE REMOVED FROM FISH.

Environmental Science and Technology, Vol 3, No 7, p 613, July 1969.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Pesticide removal, Pesticide residues, Public health, Pesticide kinetics, Delaware River, Fish.
Identifiers: Fish flesh, Fish contamination, Cooking, Food preparation, Pesticide occurrence.

A two year monitoring program conducted by the Bureau of Sport Fisheries and Wildlife found chlorinated hydrocarbon residues in fish from 45 U.S. rivers and lakes. The highest DDT concentration, 45.27 ppm, was found in white perch from the Delaware River. Up to 55% of the DDT in fish flesh can be removed by deep frying, 36% by broiling, 25% by pan-frying and 11% by baking. (LeGore-Washington)
W71-09665

INORGANIC COMPOSITION OF GALLBLADDER BILE FROM FASTED RAINBOW TROUT,
Bureau of Sport Fisheries and Wildlife, LaCrosse, Wis. Fish Control Lab.
Joseph B. Hunn.
The Progressive Fish Culturist, Vol 31, No 4, p 221-222, October 1969. 1 tab, 9 ref.

Descriptors: *Fish physiology, *Ions, *Biochemistry, *Salts, Rainbow trout, Inorganic compounds, Calcium, Magnesium, Phosphorous, Sodium.
Identifiers: *Starved fish, Fasting, Starving, Salmo sp, Bile, Chloride.

Fasting fish are subject to an obligatory loss of salt by way of urine. These salts can be replaced by ion uptake across the gills and for a limited period from the intestine, but bile has been given little study as a source of intestinal salts. Rainbow trout (Salmo gairdneri) were fasted for 96 hr before samples were taken. Gallbladder bile from these fish contained concentrations of sodium, potassium, calcium and magnesium that exceeded those of the plasma. Concentrations of chloride and inorganic phosphate were less than those in the plasma. Bile may make significant contributions of Na, K, Ca and Mn to the intestinal tract, thereby influencing enzymatic activity and osmoregulation. (LeGore-Washington)

OXIDATIVE METABOLISM OF ROTENONE IN MAMMALS, FISH, AND INSECTS AND ITS RELATION TO SELECTIVE TOXICITY,
Institute of Physical and Chemical Research, Tokyo (Japan). Lab. of Insect Toxicology.
Jun-Ichi Fukami, Takashi Shishido, Kazuo Fukunaga, and John E. Casida.
Agricultural and Food Chemistry, Vol 17, No 6, p 1217-1226, Nov-Dec 1969. 3 fig, 5 tab, 35 ref.

Descriptors: *Rotonone, *Toxicity, *Fish physiology, *Animal physiology, *Metabolism, Pesticides, Piscicides, Pathology, Inhibitors, Biochemistry, Respiration.
Identifiers: *Toxicity mechanism, *Mechanism of toxicity, *Selective toxicity, *Detoxification, *Liver function.

Rotenone inhibits the respiration of mitochondria by blocking the reduced nicotinamide adenine dinucleotide (NADH) - dehydrogenase segment of the respiratory chain. It appears that rotenone's selective toxicity, i.e. moderate toxicity to mammals vs. extreme toxicity to fish and insects, depends upon differences in the distribution pattern or in the detoxification rate of rotenone in various organisms. The results of described in vivo and in vitro studies on rotenone detoxification indicate that the effects of components in the soluble fraction of liver homogenates possible are related to the selective toxicity of rotenone to mammals, fish and insects. (LeGore-Washington)
W71-09668

EFFECT OF ETHANOL, BOURBON AND VARIOUS ETHANOL LEVELS ON Y-MAZE LEARNING IN THE GOLDFISH,
Boston City Hospital, Mass. Alcohol Study Unit; and Harvard Medical School, Boston, Mass.
Ralph S. Ryback.
Psychopharmacologia (Berl), Vol 14, p 305-314, 1969. 5 tab, 17 ref. National Inst of Mental Health Grant No 09245.

Descriptors: *Alcohols, *Fish physiology, *Fish behavior, Fish passages, Fish guiding, Toxicity, Inhibitors, Water pollution effects, Psychological aspects, Social behavior (Animals).
Identifiers: *Ethanol, *Goldfish, *Learning.

The effects of exposure of goldfish (15.20 cm long) to various concentrations (400 to 650 mg/100 ml) of ethanol were investigated relative to rate of learning and to retention of learning. Large amounts of ethanol generally interfere with performance. Subjects continuously exposed for 6 hrs 'adapted' to high ethanol levels. The reduction in the observed pharmacological effect of ethanol is due more to the prolonged presence of ethanol in the brain than to whether the level is rising or falling. There is a difference between the behavioral effect of ethanol, with a low congener content, and bourbon, with a high congener content. The goldfish is offered as a heuristic model for investigation of biological effects of ethanol. (LeGore-Washington)
W71-09669

STATE-DEPENDENT OR 'DISSOCIATED' LEARNING WITH ALCOHOL IN THE GOLDFISH,
Boston City Hospital, Mass. Alcohol Study Unit; and Harvard Medical School, Boston, Mass.
Ralph S. Ryback.
Quarterly Journal of Studies on Alcohol, Vol 30, No 3, p 598-608, September, 1969. 4 tab, 28 ref. National Inst of Mental Health Grant No MH-09245-01.

Descriptors: *Alcohols, *Fish physiology, *Fish behavior, Fish passages, Fish guiding, Toxicity, Inhibitors, Water pollution effects, Psychological aspects, Social behavior (Animal).
Identifiers: *Goldfish, Carassius auratus, Learning.

State-dependent learning with alcohol was investigated in 32 large goldfish, each trained in a Y-maze daily until a criterion of 18 out of 20 correct turns was obtained. On the next day the groups were either trained in an alcohol solution or in water, and were later tested in alcohol or in water. Results indicated that alcohol during training impaired learning, but that its effect during testing depended on its presence during training. In a second experiment, 4 groups of 6 fish were either trained in water or in an alcohol solution (400 mg per 100 ml) after being immersed in the alcohol for 2 hrs, and were tested 3 days later in water or in the same concentration of alcohol. An additional 6 fish were trained in alcohol after being in the alcohol for 6 hrs, and were tested 3 days later in water. The group taught in alcohol, but tested in water exhibited poor knowledge retention, but all other groups showed good retention. The results are discussed in relation to blackouts in alcoholics and learning under the influence of alcohol. (LeGore-Washington)
W71-09670

TOXICITY OF PESTICIDES WITH A HIGH CONTENT OF 4,6-DINITRO-O-CRESOL FOR FISH (In Czech),
Vyzkumny Ustav Rybarsky a Hydrobilogicky Vodnany, Prague (Czechoslovakia).
Z. Svobodova.
English summary. Buletin VUR Vodnany, Vol 6, p 20-25, 1970. 4 tab, 12 ref.

Descriptors: *Pesticides, *Toxicity, *Lethal limit, *Toxins, *Organic pesticides, *Agricultural chemicals, Bioassay, Physiological ecology, Fishkill, Mortality, Pesticide kinetics, Organic compounds, Pollutant identification, Water pollution effects, Runoff, Chemcontrol, Pesticide residues.
Identifiers: Cresol, LD-50, DNOK.

The toxicity to fish of newly developed pesticides containing 4,6-dinitro-o-cresol (DNOK) was investigated. The trade compounds were Nitrosan 50, Rafex 50, Zimni postrik I and Zimni postrik II (winter spray I and II). Toxicity depends upon percent DNOK content, upon the response of the pH noxious bath, and upon the nature of the remaining substances contained in the preparation. According to results, it is possible to arrange the preparations in order of decreasing toxicity: Zimni postrik II, Rafex 50, Nitrosan 50 and Zimni postrik I. Nevertheless, all the above must be considered noxious to fish. (LeGore-Washington)
W71-09671

TOXICITY OF PCP FOR THE 'DOJO' FISH, MISGURNUS ANGUILLICAUDATUS (CANTOR), WITH SPECIAL REFERENCE TO THE ESTIMATION OF SIZE FACTOR (In Japanese),
Ihara Agricultural Chemicals Inst., Shimizu (Japan).
Sumio Nagasawa, Shoji Asano, and Kazunobu Kondo.
English summary. Japanese Journal of Applied Entomology and Zoology, Vol 7, No 4, p 300-306, 1963. 1 fig, 2 tab, 7 ref.

Descriptors: *Bioassay, *Toxicity, *Lethal limit, *Weight, *Statistical methods, *Analytical techniques, *Phenols, *Fish physiology, Regression analysis, Poisons, Toxins, Laboratory tests, Testing, Water pollution effects, Environmental effects.
Identifiers: *Body weight, *Dose, Drugs, Correction factors, Multiple regression.

In many experiments relative to effects of drugs and poisons on animals differing in size but otherwise similar, the same dose is given to each individual as if its action were independent of body size. A size factor for equalizing individual differences in body weight can be determined experimentally for each drug by multiple regression. This approach was applied to the rate of effect of pentachlorophenol (PCP) on the 'Dojo' fish. After exposure of each fish to PCP, the lethal time was measured in minutes and the following regression was obtained: Y — -0.05834 .. 0.58337x1 - 0.16823x2, where: Y — log (100/minutes survival), x1 — log ppm of dose, and x2 & log grams of fish body weight. Lethal dose to body weight was not directly proportional. (LeGore-Washington)
W71-09672

SEXUAL DIFFERENCE IN HEAT RESISTANCE OF THE OZARK MINNOW, DIONDA NUBILA (FORBES),
Arkansas Univ., Fayetteville. Dept. of Zoology.
Claude D. Baker, William H. Neill, and Kirk Strawn.
Transactions of the American Fisheries Society, Vol 99, No 3, p 588-591, July 1970. 1 fig, 11 ref. NSF Grant No GY-322.

Descriptors: *Heat resistance, *Environmental effects, *Fish physiology, *Physiological ecology, *Lethal limit, *Water temperature, Bioassay, Acclimatization, Temperature, Sexual maturity, Gonads, Mortality, Fishkill, Fish diseases, Aquatic environment, Water quality, Fish reproduction, Resistance, Heated water, Thermal water.
Identifiers: Sex, Sex differences, Death point, End point.

The intraspecific variation in heat resistance in the Ozark minnow, Dionda nubila was studied. Fish were acclimated for 7 days and subjected to a stress of 36.5, 37.0 or 37.5C. Cessation of gill movement was considered the death point. In general, pooled sample median resistance times of males were less than half those of females tested at equivalent temperatures. Brightly colored males, i.e., those approaching spawning condition, were generally the first of a particular sample to die. The difference between male and female heat resistance could not be attributed to size. (LeGore-Washington)
W71-09673

EFFECT OF M.S. 222 ON NITROGEN EXCRETION OF THE BLUEGILL (LEPOMIS MACROCHIRUS),
Loyola Univ., Chicago, Ill. Dept. of Biology.
Jan Savitz.
The Journal of the Elisha Mitchell Scientific Society, Vol 85, No 4, p 150-151, Winter 1969. 1 tab, 10 ref. US Dept of Interior, Graduate Educational Grant No 14-17-007-403 (G).

Descriptors: *Water pollution effects, *Fish physiology, *Nitrogen, Bioassay, Chemical wastes, Environmental effects, Fish toxins.
Identifiers: *MS 222, *Anesthetics, *Fish anesthetics, *Excretion, Drugs, Drug effects, Biochemical wastes.

Because M.S. 222 (tricaine methanesulphonate) anesthetizes fish, it was also expected to lower their nitrogen excretion rate. Static bioassays were used, with pre- and post-treatment water samples being analyzed for nitrogen content. The nitrogen excretion rates for bluegills treated with 0.003% M.S. 222 for one day were not significantly different from those of untreated controls. (LeGore-Washington)

THE 1967 SHARK KILL IN SAN FRANCISCO BAY,
East Bay Regional Park District, Oakland, Calif.; and California Academy of Sciences, San Francisco, Calif. Steinhart Aquarium.
Ronald A. Russo, and Earl S. Herald.
California Fish and Game, Vol 54, No 3, p 215-216, 1968.

Descriptors: *Water pollution effects, *Fishkill, *Mortality, *Elasmobranches, *Sharks, Water pollution sources, Fish behavior, Bottom fish, Physiological ecology, Environmental effects, Fish conservation, Fish diseases.
Identifiers: *Stingrays, *Rays, San Francisco Bay, Triakis sp, Rhinotriacis sp, Notorynchus sp, Myliobatis sp.

During July and August, 1967, more than 725 elasmobranchs of four species (Triakis semifasciata, Rhinotriacis henlei, Notorynchus maculatus and Myliobatis californicus) were collected from a fishkill in the Alameda Beach area of San Francisco Bay. Of interest was the aberrant behavior of the shark, R. henlei, which often and repeatedly beached themselves. All four species are bottom dwelling elasmobranchs, as opposed to fast-swimming elasmobranch species. The responsible pollutant, therefore, must have been something which spread over the bottom of the bay for a considerable area and which had a breakdown period of greater than two months. The source of the contamination was not located. (LeGore-Washington)
W71-09677

TOXICITY AND TREATMENT OF DE-INKING WASTES CONTAINING DETERGENTS,
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia).
D. W. Martens, R. W. Gordon, and J. A. Servizi.
International Pacific Salmon Fisheries Commission, Progress Report No 25, 1971. 24 p, 2 fig, 8 tab, 15 ref.

Descriptors: *Water pollution effects, *Detergents, *Chemical wastes, *Water pollution sources, *Water pollution treatment, *Salmon, *Fish physiology, *Oxygen demand, *Biochemical oxygen demand, *Toxicity, *Waste treatment, Cleaning, Pink salmon, Sockeye salmon, Industrial wastes, Waste water treatment, Lethal limit, Pulp wastes.
Identifiers: *Paper processing, *Detoxification, Fraser River, De-inking wastes, Nalco 808, Sterox MJ-b.

Some lethal and sublethal effects on juvenile sockeye (Oncorhynchus nerka) and pink salmon (O. gorbuscha) of proposed de-inking wastes and their contained detergents were investigated. Toxicity was attributed primarily to the waste's content of nonionic detergents, Nalco 808 and Sterox MJ-b, which caused lethary, excessive mucous secretion on gills and depressed oxygen consumption at concentrations less than the lethal level. The biochemical oxygen demand (BOD) of de-inking wastes was easily reduced by biological treatment, but the wastes were generally not readily detoxified owing to resistance of the detergents to degradation. Detergents were removed from solution by activated carbon, but this method of treatment would be impractical. The alternatives for treatment of the proposed wastes appeared to be selection of detergents which would be readily detoxified during biological treatment, or selection of a method capable of removing the detergents. (LeGore-Washington)

II. SUBLETHAL EFFECTS AND CHANGES IN ECOSYSTEMS: ASSESSMENT OF THE EFFECTS OF POLLUTANTS ON PHYSIOLOGY AND BEHAVIOUR,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
J. M. Anderson.
Proceedings of the Royal Society of London B, Vol 177, p 307-320, 1971. 11 fig, 1 tab, 21 ref.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Water pollution effects, *Acclimatization, *Salmonids, *Fish physiology, *Water temperature, *Lethal limit, *Inorganic compounds, *Physiological ecology, *Environmental effects, Salmon, Trout, Temperature, Pesticides, Potassium compounds, Water quality.
Identifiers: *Chronic pollution, *Dinitrophenol, *Potassium cyanide, Salvelinus sp, Salmo sp.

The effects were studied of chronic pollution upon salmonid fishes. It is noted that exposure to DDT influences temperature selection and acclimation by salmon (Salmo salar) and brook trout (Salvelinus fontinalis). Low doses lower, and high doses raise the preferred temperature. Likewise, DDT raises the lower lethal temperature of fish, although it has no apparent effect on the upper lethal temperature. Effects of potassium cyanide and dinitrophenol upon temperature preference are also discussed, as are the effects of DDT upon learning and the biological effects of heavy metals. Ecological implications of these observations are discussed. (LeGore-Washington)

MASS MORTALITY OF THE CREVALLE JACK, CARANX HIPPOS (LINNAEUS) ON THE ATLANTIC COAST OF MASSACHUSETTS,
Southeastern Massachusetts Univ., North Dartmouth.
James G. Hoff.
Chesapeake Science, Vol 12, No 1, p 49, March 1971. 1 fig, 4 ref.

Descriptors: *Fishkill, *Mortality, *Water temperature, *Cold springs, *Migration, *Fish physiology, *Environmental effects, *Cold re-

sistance, Temperature, Spring waters, Running waters, Fish diseases, Aquatic environment, Ecology, Physiological ecology, Saline water fish, Water pollution effects.
Identifiers: *Estuarine fish, *Caranx sp., Jack crevalle, Crevalle jack, Natural pollution.

A hydrographic and biological survey was conducted in the Slocum River, Massachusetts for over two years prior to October 18, 1969. On this date, over 200 dead juvenile jack crevalle (Caranx hippos) were found, although the mortality is estimated to have been greater. Death was reasoned to have been caused by low water temperature (7.4 - 9.0C). Other species were apparently unaffected. (LeGore-Washington)
W71-09680

AVOIDANCE OF ANOXIC CONDITIONS BY THE SAND SHRIMP, CRANGON SEPTEMSPINOSA SAY,
Maine Univ., Orono.
Paul A. Haefner, Jr.
Chesapeake Science, Vol 12, No 1, p 50-51, March 1971. 1 fig, 1 tab, 5 ref. NSF Grant GB-6856.

Descriptors: *Dissolved oxygen, *Animal physiology, *Physiological ecology, Oxygen sag, Bioassay, Shrimp, Bioindicators, Environmental effects.
Identifiers: *Anoxia, *Hypoxia, *Avoidance, *Detection, *Sensory detection, Sand shrimp, Crangon sp.

The sand shrimp, Crangon septemspinosa, can detect and does avoid hypoxic and anoxic environmental conditions. Tests were carried out in a preference chamber at 5C and at 15 ppt salinity. Nitrogen gas was bubbled through water to create the hypoxic condition. The survival value of the demonstrated behavior becomes obvious when one considers that this species is often subjected to localized hypoxic stress in its estuarine environment. (LeGore-Washington)
W71-09682

WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH. REPORT ON EXTREME PH VALUES AND INLAND FISHERIES,
Food and Agriculture Organization of the United Nations, Rome (Italy). European Inland Fisheries Advisory Commission.
R. Lloyd.
European Inland Fisheries Advisory Commission Technical Paper No 4, 1968. 24 p, 1 tab, 75 ref.

Descriptors: *Water pollution effects, *Lethal limit, *Hydrogen ion concentration, *Acidity, *Alkalinity, *Freshwater fish, *Fish behavior, *Aquatic environment, *Reviews, Impaired water quality, Resistance, Acidic water, Fishkill, Mortality, Pollutants, Water properties, Acid streams, Fish, Fish diseases, Fish physiology, Physiological ecology.
Identifiers: *Avoidance, Toxic mechanism, Mechanisms, Physiology.

A normal range of pH values is known to support good fisheries. A critical review is presented of published and unpublished data on direct and indirect effects of extreme pH on fish. There is no definitively established pH range within which a fishery remains unharmed and outside which it is damaged, but there is a gradual deterioration of the fishery as the pH values are further removed from the normal range. A pH range of 5-9 is not directly lethal to fish, but the toxicity of several common pollutants is markedly affected by pH changes within this range. Below pH 5.0, fish mortalities may be expected, and the productivity of a fishery is reduced. Some species may be acclimated to values as low as 3.7. Data on high pH are not extensive and probably reflect the lesser importance of this aspect. pH values between 9 and 10 may be harmful to a few species of fish, and higher levels are lethal to many more. It is observed that fish avoid zones of extreme pH value. (Katz-Washington)
W71-09683

MINERALIZATION OF ORGANIC PHOSPHORUS IN OLIGOTROPHIC LAKE SEDIMENTS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
Dwight A. Webster, and Carl L. Schofield.
Available from the National Technical Information Service as PB-201 002, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 29, April 1971, 25 p, 7 fig, 6 tab, 15 ref. OWRR Project A-026-NY (1).

Descriptors: Lakes, *Oligotrophy, Lake soils, Limnology, *Sediments, *Phosphorus, Compounds, Organophosphorus, Compounds, Aquatic plants, *Nutrient requirements, Fersility, *Soil chemistry, Benthic flora, Enzymes, Water pollution effects.

An investigation of the amount, forms, lability, and significance of the sediment organic phosphorus pool was conducted in two small, oligotrophic lakes in the Adirondack Mountain region of New York State. The lakes differed markedly in productivity, but similar morphometric features (low mean depth and low ratio of water volume/ sediment area) enabled the sediments to play significant, but contrasting roles in the metabolism of the lakes. In the unproductive lake, the sediments behaved mainly as a sink for phosphorus. Benthic plants in this lake showed evidence of phosphate limitation (low content of 'stored' phosphate and high phosphatase activity), resulting from low sediment phosphate availability. Rates of organic phosphorus mineralization were low and partly inhibited by low substrate availability. The low lability of both inorganic and organic phosphates was atributed to the high retention capacity of an iron dominated retaining phase in the sediments. Sediments in the productive lake were considered to constitute a considerable reservoir of available phosphate. The benthic community was well developed and nutritional assay of the plants indicated that they were well supplied with phosphate. The sediments in this lake were dominantly autochthonous, low in Fe and Al, and had a low phosphate retention capacity. Substrate availability was greater, as were hydrolysis rates of organic phosphorus. Mineralized phosphate was more readily available, primarily because the inorganic phosphate retaining phase was near saturation, thus resulting in the formation of a pool of highly labile surface phosphate.
W71-09738

ROLE OF EXCRETED CHLORTETRACYCLINE IN MODIFYING THE DECOMPOSITION PROCESS IN FEEDLOT WASTE,
Colorado State Univ., Ft. Collins. Dept. of Microbiology.
G. Keith Elmund, S. M. Morrison, D. W. Grant, and M. P. Nevins, Sr.
Bulletin of Environmental Contamination and Toxicology, Vol 6, No 2, 1971, p 129-131.

Descriptors: *Farm wastes, Biodegradation, *Biochemical oxygen demand, Bactericides, Toxicity, *Stabilization, Bioassay, Biological treatment, Diets, Water pollution effects, Feeds, Cattle, Ruminants, Pollutant identification.
Identifiers: Feedlot wastes, Dietary antibiotic, Rumen microflora, *Chlortetracycline.

Quantitative bioassays of fresh feedlot manure revealed that approximately 75 percent of the dietary chlortetracycline was excreted. The antibiotic concentration was 14 microgram g/gm of fresh feedlot manure, and 0.34 microgram g/gm of aged feedlot manure. Standard BOD5 values on manure from control steers and manures from steers receiving dietary chlortetracycline demonstrated that antibiotic supplementation of animal feeds may alter the microflora participating in the stabilization of feedlot manure. The effect of ingested chlortetracycline is two fold: (1) ingested antibiotic selects for a microbial population relatively inefficient in the stabilization process and (2) antibiotic supplementation apparently alters the digestive processes in the animal, resulting in manures which are less biodegradable as measured by the standard BOD5 procedure. (Christenburg-Iowa State)

POLLUTION, PESTICIDES AND THE PEOPLE -- AGRICULTURE AND OUR NATURAL ENVIRONMENT.
Greater Des Moines Chamber of Commerce, Iowa. Agricultural Dept.

33rd Annual (Forum), National Farm Institute, February 11-12, 1971, Des Moines, Iowa, 107 p.

Descriptors: *Farm wastes, *Pesticides, *Sediment, *Water pollution effects, Fertilizers, Economics, Legislation, Water pollution control, Benefits, Costs, Agriculture standards, Water quality, Taxes, DDT, Population, Livestock, Environment, Sewage.
Identifiers: Conservancy districts.

The proceedings of the National Farm Institute include papers concerned with the various aspects of pollution and today's environment. Various pollutants which are discussed include farm wastes, fertilizers, pesticides, and sediment. In addition, other papers report on population aspects, legislation, economics of pollution control, and interest groups concerned with pollution. A wide array of views and potential control systems are examined. (See also W71-09753 thru W71-09764) (White-Iowa State)

THE SPORTSMAN'S VIEW,
National Wildlife Federation.
Phillip Douglas.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 15-22.

Descriptors: *Pesticides, *DDT, Water pollution effects, Conservation, Biodegradation, Recreation, Diseases, Beneficial use, Toxicity, Solubility, Fish, Birds, Biocontrol, Cultural control.
Identifiers: *Biological concentration, Primary effects, Secondary effects.

Both sides of the pesticide problem are presented in this paper. Pesticides, and in particular DDT, have been used successfully to help control typhus fever, malaria, and dutch elm disease among others. These beneficial effects are sometimes offset by their harmful residues. The DDT molecule combines four properties that are responsible for its behavior in the environment: (1) toxicity to almost all animal life; (2) persistence; (3) mobility; and (4) solubility properties. Many examples of fish and bird fatality are pointed out as the result of the accumulation of DDT. Ususally these are the higher animals in carnivorous food chains. Twelve steps or courses of action are recommended to help alleviate the problem. (See also W71-09752) (White-Iowa State)

THE CITIZENS' VIEW OF POLLUTION,
League of Women Voters of the United States, Washington, D.C. Environmental Quality Program.
Donald Clusen, Mrs.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 7-13.

Descriptors: *Environment, *Water pollution effects, Pollution abatement, Legislation, Governments, Research and development, Water quality, Standards, Water Quality Act, Taxes, Agriculture.

The author attempts to give societies view of pollution while admitting that the role of spokesman is a dangerous one. Trying to describe pollution or

what it is constitutes a problem as varied as trying to prescribe solutions. There is no national consensus on environmental questions unless it is that a problem exists and the time to deal with it is now. An aroused public must insist that more be done, and faster, to abate pollution. Equally important is the preparation of a number of alternatives. Water resource development must be viewed as an integral part of the national effort to protect and improve the quality of man's environment. The general public has demonstrated that they want their money spent for pollution abatement. People want to have a voice in the choices to be made, they want to see some progress made, and they want environmental concerns to have a higher priority - in government, business and agriculture. W71-09755

THE FARMERS' CONCERN,
Gilbert Stanek.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 23-29.

Descriptors: *Wastes, *Water pollution effects, Dieldrin, DDT, Mercury, Pesticides, Insecticides, Herbicides, Resistance, Research and development, Education, Regulation.
Identifiers: *Panic power, Mis-use, Tolerance level.

Farmers have four areas of concern in the environmental pollution field. The first is 'panic power' created by news media and other sources that cry out in unsure, uninformed voices about the uncertainties of pollution. The second area is mis-use or the improper handling of wastes and pesticides by farmers as well as non-farmers. The third area deals with tolerance levels. What criteria should be used and what levels should be set are questions which remain largely unanswered. The fourth area of concern to farmers is that they are a minority group. We are warned that if the American farmers' efficiency of production is jeopardized by banning of pesticide usage, the consumer will suffer through increased food prices because of reduced production. Research, education and regulation are key steps to preserve our standard of living. (See also W71-09752) (White-Iowa State)
W71-09756

POPULATION GROWTH RATE SHOULDN'T GET ALL THE BLAME,
Bureau of the Census, Washington, D.C.
Conrad Taeuber.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 31-39.

Descriptors: *Human population, *Growth rates, Fertility, Fecundity, Census, Cities, Water pollution effects, Natural resources.

Population growth characteristics of the United States are pointed out. The growth rate is traced from pre-war times to present, with projections being made for future growth. Pollution and other social ills are not primarily a result of our rate of population growth. Changing standards and habits, in activities, technology, and the style of life have much more to do with the accumulation and disposition of waste materials and pollutants than does the number of persons involved. (See also W71-09752) (White-Iowa State)
W71-09757

PESTICIDES,
Environmental Protection Agency, Washington, D.C. Pesticide Advisory Committee,
William M. Upholt.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa p 49-56.

Descriptors: *Pesticides, *DDT, Diseases, Insecticides, Public health, Toxicity, Pesticide residue, Hazards, Poisons, Beneficial use, Water pollution effects.
Identifiers: *Parathion, Malaria, Cancer.

Pesticides are discussed with three main areas of emphasis. DDT is used as an example, but the principles are intended to apply to pesticides generally. The first area of emphasis is of the beneficial use of DDT. Increased production and the control of malaria are two main benefits. Human health hazards from pesticides are next pointed out. Death and illness have been attributed to pesticide poisoning. Currently the human health hazard that is most controversial is the possibility of cancer or birth defects from exposure to pesticide concentrations. Environmental hazards are the last area of concern. Biological accumulation and persistence in the environment are two main problems. The author suggest a drastic reduction in the use of DDT as one solution. Pesticides are useful, but they all carry some risk of damage to man or the environment. SPECIFIC COMPOSITION OF PHYTOPLANKTON IN A LAKE WARMED UP BY WASTEWATER FROM A THERMAL POWER STATION AND IN LAKES WITH NORMAL TEMPERATURES,
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland).
J. Poltoracka.
Translation from Polish AEC-tr-7194. Acta Societatis Botanicorum Poloniae, Polish, Vol. 37, No. 2, 1968, p. 297-325, 5 fig., 1 tab., 5 ref.

Descriptors: *Thermal powerplants, *Lakes, Temperature, Phytoplankton, Algae, Heated water, Population, Water pollution effects.
Identifiers: Species, Taxons.

A preliminary evaluation of the specific composition of phytoplankton was carried out in Lakes Lichen, Mikorzyn and Slesin, characterized by different temperatures caused by the activity of the powerplant at Konin. The highest water temperatures were displayed by Lake Lichen (7.4-27.5C), and the lowest temperatures prevailed in Lake Slesin (0.8-20.7C). During the entire period of investigation in all three lakes, 305 species were found and 414 taxons were identified. Predominant among them were Bacillariophyceae (44 percent), chlorophyceae (34 percent) and cynonphyceae (11 percent). The highest number of phytoplankton components (285) were found in Lake Lichen, and their lowest number (197) was ascertained in Lake Slesin, which was associated with great differences in the share of chlorophyceae whose highest number was found in the warmest, Lake Lichen, whereas their lowest number was discovered in Lake Slesin, the coldest lake. The number of species of algae in Lake Lichen was rather stable throughout the year but fluctuated seasonally in other lakes. A most marked correlation between the number of the taxons of algae and surface water temperature was observed in Lake Lichen. With respect to the size of individual population, 14 planktonic species were dominant at various periods in different lakes. (Upadhyaya-Vanderbilt)

ELECTRIC POWER GENERATION AND THE ENVIRONMENT,
Westinghouse Electric Corp., Pittsburgh, Pa. Environmental Systems Dept.
James H. Wright.
Westinghouse Engineer, Vol. 30, No. 3, May, 1970, p. 66-80, 8 fig., 7 tab., 9 ref.

Descriptors: *Thermal pollution, *Environment, *Thermal powerplants, *Radiation, *Standards, *Temperature, Background radiation, Tritium, Water pollution effects.
Identifiers: Air pollutants, Krypton, Discharged heat, Heat dissipation, Exposure, Pressurized water reactors, Fossil fuels.

In this review, effects of steam electric generating stations, their emissions and resulting effects of those emissions on local and global environments have been briefly discussed. The United States, with 6 percent of the world's population, consumes 35 percent of the fossil fuels available and produces more than its share of pollution. Typical background exposures result in radiation doses to local residents in the range of 100 to 200 millirem per year. However, much larger exposures have been observed in certain locations such as in Kerala, India (1300 millirem per year) and granite areas of France (265 millirem per year). A brief history of establishment of radiation standards and a summary of Federal Radiation Council standards is given. Radiation from reactor effluents has been studied for exposure to the general population following typical releases and exposure at site boundary during normal plant operation. Results of the calculation of radiation releases from a 1000 MWe pressurized water reactor plant is given. Long term build-up of radioisotopes in the biosphere, carbon monoxide, oxides of nitrogen and sulfur, particulates and hydrocarbons emissions are also discussed. Federal Water Quality criteria for temperature, methods of heat dissipation and heat release on a planetary scale is discussed briefly. (Upadhyaya-Vanderbilt)
W71-09768

MERCURY POLLUTION: INTEREST IN IT NOW ON THE UPSWING,
Industrial Pollution Control, Inc., Westport, Conn.
T. W. Lesperance.
Water and Wastes Engineering, January, 1971, p. A13-16.

Descriptors: *Heavy metals, *Chemical wastes, Water pollution sources, Poisons, Water pollution effects, Standards, Industrial wastes, Waste water treatment, Fish, Toxicity, Human pathology, Public health.
Identifiers: *Mercury.

Since industries became aware of the danger of mercury pollution, mercury consumption has dropped 11% in the last two years. The industries have started reclaiming and recycling large quantities of mercury that were formerly wasted. A standard of 0.005 mg/l of mercury in drinking water has

been proposed. Mercuric chloride at .0001 molar concentration was shown to inhibit several biological processes to values less than 5% of the original rate. The main effect on man is to the central nervous system. The best method of the detection of mercury is the colorimetric determination with dithizone. A list of possible industrial sources of mercury pollution is discussed. Among the possible treatment methods condensation precipitation, reverse osmosis and dialysis, lime treatment, etc., are mentioned. (Novotny-Vanderbilt)
W71-09774

MERCURY IN MAN,
Washington Univ., Seattle. School of Medicine.
Neville Grant.
Environment, Vol. 13, No. 4, p. 2-15, May, 1971, 8 fig., 29 ref.

Descriptors: *Heavy metals, *Poisons, *Toxicity, Food chains, Path of pollutants, Environmental effects, *Human diseases, *Public health, Fish, Foods, Fungicides, Agricultural chemicals, Standards, Air pollution, Water pollution effects, Circulation, Chromosomes.
Identifiers: *Mercury, Acceptable daily intake, *Methyl mercury, Human body, Brain, Tissue, Fetal damage, Half-life.

A series of alarming mercury contamination events is presented including the recent finding of 36 ppm of mercury in some health food tablets, made from compressed seal liver. Pathways of mercury in the system are illustrated, the cycle beginning with industry burning natural fuels. These emissions in the USA contribute some 275-1800 tons of mercury being released to the air annually. Mercury reaches man through food, particularly fish. Agricultural products are also of importance because of mercurial fungicides being freely used. Effects of various forms of mercury on man are depicted, levels of exposure are discussed, relation of methyl mercury levels in blood to physical hazard and specific areas of concentration in the human body are demonstrated. The relationship between methyl mercury intake and levels of methyl in brain tissue has been calculated. (Oleszkiewicz-Vanderbilt)
W71-09778

THERMAL POLLUTION FISHKILL.

American Association of Professors in Sanitary Engineering Newsletter, Vol. 6, No. 3, p. 15, April, 1971 (taken from Sports Fishing Institute Bulletin).

Descriptors: *Fishkill, *Thermal powerplants, *Temperature, *Thermal pollution, *Leakage, Bioassay, Acclimatization, Water pullution effects.
Identifiers: *Susquehanna River, Pennsylvania Power and Light, Rapid temperature drop.

A 720-MW generation unit at a thermal power plant on the Susquehanna River developed a water leak on February 4, 1971, and had to be shut down. This resulted in a sudden drop of water temperature which caused an estimated fishkill of 15,388 fish of value. A sudden 44F temperature drop-to 36F-caused the kill. This was clearly a thermal-pollution caused fishkill because the fish accumulated below the plant in the vicinity of warm water influence and died of exposure to the cold when the artificial heat had been cut off. The note also mentions thermal pollution studies on rapid water temperature changes, conducted at Vanderbilt University which demonstrates the extremely slow rates of temperature decrease which may still prove fatal to fish. (Oleszkiewicz-Vanderbilt)
W71-09781

DOW SUED BY ONTARIO FOR POLLUTION DAMAGE.

Chemical Week, Vol. 108, No. 12, p. 12, March 24, 1971.

Descriptors: *Heavy metals, Water pollution control, *Jurisdiction, *Lake Erie, Standards, Chlorine, Water pollution effects.
Identifiers: *Mercury, Dow Chemical of Canada, Ontario, *St. Clair River, *Detroit River.

The Ontario government's $25 million mercury pollution suit against Dow Chemical of Canada may set a precedent in instances where industry allegedly despoils the environment. In addition, the suit asks that Dow render harmless the mercury sediments on the bottom of St. Clair and Detroit Rivers, Lake St. Clair and Lake Erie or pay the province an additional $10 million for dredging the bottom. The new Federal Department of Environment for Renewable Resources said that it will require for all plants a maximum discharge of 0.005 lb. mercury/ton of chlorine by September 1, 1971, and by the end of the year limitation to the natural background. It is reported that Dow has reduced its release to 0.0009 lb. of mercury/ton chlorine. (Oleszkiewicz-Vanderbilt)
W71-09784

EFFECTS OF PULP MILL EFFLUENT ON WATER QUALITY AND BIOTA TRACE ELEMENT CHARACTERISTICS,
Bedford Inst., Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
J. M. Bewers, and G. J. Pearson.
Atlantic Oceanographic Laboratory Report 1970-8, November 1970, 57 p, 5 fig, 14 tab, 11 ref. AOL Report 1970-8.

Descriptors: *Water pollution effects, *Pollutant identification, *Pulp and paper industry, *Pulp wastes, *Water quality, *Biota, *Trace elements, Suspended load, Sediments, Solid wastes.
Identifiers: Transparency.

An attempt to obtain representative histograms of the chemical environment by employing neutron activation analysis to determine naturally occurring elements at fairly low levels was made in 1965 in a 400 acre tidal lagoon in Pictou County, Boat Harbor, Nova Scotia. This area is a treatment facility for wastes from the Scott Maritimes Bleached Kraft Pulp Mill. Four types of filter-feeding organisms were studied in this area of high concentrations of suspended solids and large quantities of unnatural chemical species. The chemical composition of the biota and suspended solids and the distribution of the suspended solids were studied to reflect the chemistry of the habitat. (Ensign-PAI)
W71-09793

LAMINARIA SACCHARINA AND MARINE POLLUTION IN NORTH-EAST ENGLAND,
Liverpool Univ. (England). Dept. of Botany.
E. M. Burrows, and C. Pybus.
Marine Pollution Bulletin, Vol. 2, No. 4, p 53-56, April 1971.

Descriptors: *Pollutant identification, *Bioindicators, *Algae, Growth rates, Cultures, Suspended load, Sewage, Industrial wastes, Silts, Water pollution effects.
Identifiers: *England, *Laminaria saccharina.

The growth rate of Laminaria saccharina in both the laboratory and in the field has been studied as an indicator for the effects of pollution on the north-east coast of England. This species provides a constant substrate for other marine organisms over a large area of the coast making it an important component of the coastal ecosystem. Laminaria saccharina is very sensitive to its environment and therefore is capable of giving a graded response to different types and degrees of pollution. The factor thought to inhibit growth most was the presence of silt; however pollution of the waters themselves having deleterious effects on growth cannot be ruled out. (Ensign-PAI)
W71-09795

MERCURY IN THE ADRIATIC,
Tokyo Univ. (Japan). Dept. of Urban Engineering and Kobe, Univ. (Japan). Dept. of Public Health.
Jun Ui, and Shoji Kitamara.
Marine Pollution Bulletin, Vol. 2, No. 4, p 56-58 April 1971.

Descriptors: *Water pollution, *Heavy metals, *Fish, *Food chains, *Human diseases, Public health, Toxicity, Environmental effects, Water pollution effects.
Identifiers: *Mercury, *Adriatic Sea, Minamata disease, Genetical change, Japan, Sweden, Italy.

Environmental pollution bo organic mercury compounds in the Adriatic is reviewed. Methyl mercury compounds accumulated in the biosphere in natural food chains have led to causing diseases in humans. These diseases and the sources of mercury pollutants causing these diseases in Japan, Sweden and Italy are discussed. (Ensign-PAI)
W71-09796

EFFECT OF CRUDE OIL AND AN OIL-SPILL DISPERSANT ON REEF CORALS,
Bellairs Research Inst., St. James (Barbados).
John B. Lewis.
Marine Pollution Bulletin, Volume 2, No. 4, p 59-62 April 1971.

Descriptors: *Oil wastes, *Emulsions, *Industrial wastes, *Coral, *Marine animals, Reefs, Detergents, Water pollution effects.
Identifiers: Caribbean, Barbados Coast, Porties porites, Agaricia agaricites, Fivia fragum, Madracis asperula.

Four species of corals from the reefs on the west coasts of Barbados were tested in laboratory experiments for the effects of crude oil and oil-spill detergents. All four species were found to be sensitive to pollution by both crude oil and the oil-spill dispersants. All were more affected by the dispersant than by the crude oil. Both pollutants had a harmful effect upon corals at concentrations of 100 to 500 ppm and recovery after 24 hr. exposure was not complete at these concentrations. (Ensign-PAI)
W71-09797

STUDIES OF ESTUARINE DEPENDENCE OF ATLANTIC COASTAL FISHES,
National Marine Fisheries Service, Highlands, N.J. Sandy Hook Marine Lab.
John Clark, W. G. Smith, Arthur W. Kendall, Jr., and Michael P. Fahay.
Bureau of Sport Fisheries and Wildlife. Technical Papers, No. 28, August 1969, 132 p, 70 fig, 3 tab, 13 ref.

Descriptors: *Estuaries, *Coasts, *Atlantic Ocean, *Fishes, Migration, Coastal engineering, Pollutants, Data collections, Temperature, Salinity, Zooplankton, Trawling, Water pollution effects.

The extent that migratory fishes of the Atlantic coast depend on estuaries as essential habitat during the early stages of their lives and the effects on fishes from physical disruption and pollution of estuaries caused by twenty years of coastal development was studied by the Sandy Hook Marine Laboratory. The basic data from a series of surveys, eight cruises of the research vessel Dolphin, from Cape Cod, Massachusetts to Cape Lookout, North Carolina during a one year period from December 65 to December 66 is reported. The data includes temperatures, salinities, zooplankton volumes, and the midwater trawl collections of fishes. (Ensign-PAI)

TURNOVER AND CONCENTRATION OF RADIONUCLIDES IN FOOD CHAINS,
Oak Ridge National Lab., Tenn. Health Physics Div.
D. E. Reichle, P. B. Dunaway, and D. J. Nelson.
Nuclear Safety, Vol 11, No 1, p 43-55 (Jan-Feb 1970).

Descriptors: *Food chains, *Mathematical models, *Radionuclides, Radioactivity effects, Water pollution effects, Nuclear wastes, Public health, Metabolism, Toxicity.

More substantial bioenvironmental information will be required to evaluate future nuclear installations. A simple source-pathway-receptor model requires pathway identification, data on assimilation by each link (organism) in the pathway, and determination of the biological turnover of each radionuclide. For chronic releases of radioactivity to the environment, evaluation of the concentration factors alone will often suffice; for acute releases, evaluation of other biological variables is needed to predict the time-dependent radionuclide concentrations in organisms. The biological concentration and turnover of radionuclides by animals are summarized in this paper, and data are presented for use in environmental models and correlation with characteristics (e. g., body size) that allow estimation of absolute values for many different animal groups based on existing experimental data. RESEARCH ON ECOLOGICAL STUDIES ON THE DYNAMICS OF PLANKTONIC BLUE-GREEN ALGAE WITH SPECIAL REFERENCE TO THEIR MICROSTRATIFICATION.
Minnesota Univ., Minneapolis.

COO-1820-2 (1970), 6 p.

Descriptors: *Aquatic algae, *Lakes, *Phytoplankton, *Density stratification, Speciation, Vertical migration, Aquaria, Growth rates, Sedimentation, Buoyancy, Wind velocity, Convection, Watter pollution effects.

Species associations at various depths are fortuitous, transient, and dependent upon physical control manifest by the abiotic environment, rather than upon any direct biological control. Individuals comprising the phytoplankton community are not bound to a substrate, and are entirely mobile. Vertical distribution is influenced by differential growth rates at various depths, sedimentation, buoyancy, wind, and thermal convection. Currently, proportionately more time is being devoted with several laboratory models of the study lakes. (Bopp-NSIC)
W71-09852

EFFECTS OF CHRONIC EXPOSURE OF CHINOOK SALMON EGGS AND ALEVINS TO GAMMA IRRADIATION,
Washington Univ., Seattle. Coll. of Fisheries.
L. R. Donaldson, and K. Bonham.
Transactions of the American Fisheries Society, Vol 99, No 1, Jan 1970, p 112-119.

Descriptors: *Chinook salmon, *Radioactivity effects, *Fish eggs, Fry, Water pollution effects, Gamma rays, Columbia River.

Chinook salmon eggs and alevins were exposed continuously to low levels of gamma radiation from the instant of fertilization until the yolk sac was completely absorbed. The level of irradiation exposure was gradually increased from 0.5 roentgen/day for the 1960 brood year to 10 roentgen/day for 1968. (The total exposure for 1968 was 820 roentgen.) There were no damaging effects found at 0.5 roentgen/day. Data for the higher levels of exposure will be evaluated as the adults return from the sea. (Bopp-NSIC)
W71-09853

EXCRETION OF IODINE BY PERCH,
Helsinki Univ. (Finland).
S. Takatalo, S. Kolehmainen, and J. Miettinen.
Transactions of the American Fisheries Society, Vol 99, No 3, Jul 1970, p 515-517, 2 fig.

Descriptors: *Iodine radioisotopes, *Perches, Absorption, Instrumentation, Radioactivity techniques, Metabolism, Water pollution effects.

Biological half lives of iodine in perch were determined at 13 and 25C by whole body counting of I-131. Iodine excretion followed a two-exponential function. At 13C the half life of the slow component was 9 days; the fast component, 1.5 days. At 25C the half lives were 5 days and 15 hours, respectively. The slow component is believed to represent clearance from the thyroid organ; the fast component, clearance from plasma. (Bopp-NSIC)

RADIATION ECOLOGY IN FRESHWATER COMMUNITIES,
Battelle Memorial Inst., Richland Wash. Pacific Northwest Labs.
C. E. Cushing.
Available from NTIS. Report BNWL-SA-3291, May 21, 1970, 17 p, 22 ref. AEC Contract No At (45-1)-1830.

Descriptors: *Radionuclides, *Aquatic life, *Public health, *Ecology, Oligotrophy, Phosphorus radioisotopes, Strontium radioisotopes, Iodine radioisotopes, Zinc radioisotopes, Cobalt radioisotopes, Absorption, Water pollution effects, Nuclear wastes, Reviews, Columbia River, Food webs.
Identifiers: Yttrium radioisotopes, Zirconium radioisotopes, Ruthenium radioisotopes, Cesium radioisotopes, Barium radioisotopes, Cerium radioisotopes, Scandium radioisotopes, Chromium radioisotopes, Manganese radioisotopes, Iron radioisotopes, Sodium radioisotopes, Copper radioisotopes, Arsenic radioisotopes.

This short review considers the following aspects of radionuclide cycling: (1) the mode of uptake, (2) rates of uptake, (3) retention-elimination, (4) food-web relationships, (5) environmental effects, and (6) dispersal of radionuclides. It is concluded that the presence of radionuclides in the freshwater environment, disregarding their source, can provide us with a wealth of ecological data. Information ranging from the movement of a single element from one organism to another, or from one tissue to another, to data helping to unsort the complexities of entire aquatic food-webs can be gained with properly designed experiments and treatment of the data. The dynamics of radionuclide cycling are basically no different from their stable counterparts, but their value lies in the increased precision of measurement, particularly at concentrations too low to measure by standard analytical procedures. (Bopp-NSIC)
W71-09855

POLONIUM-210 AND LEAD-210 IN THE MARINE ENVIRONMENT,
Department of Industries, Cape Town (South Africa). Div. of Sea Fisheries.
L. V. Shannon, R. D. Cherry, and M. J. Orren.
Geochimica et Cosmochimica Acta, Vol 34, 1970, p 701-711.

Descriptors: *Lead radioisotopes, *Sea water, *Phytoplankton, *Zooplankton, Absorption, Water pollution effects, Biology, Geochemistry, Ocean currents, Radioactivity techniques.
Identifiers: Polonium radioisotopes.

A method is outlined for determination of lead-210 and polonium-210 in sea water by solvent extraction, followed by electrodeposition and alpha counting. The mean activities of 29 samples collected at a depth of 20 m in the sea around the Cape of Good Hope during March 1969 were 38 x 10 to the minus 15th power c/l for lead and 20 x 10 to the minus 15th power c/l for polonium. Variations in concentrations could in part be ascribed to different water masses and current systems. For 11 zooplankton and 3 phytoplankton samples collected during the same period, the mean activities were 33 pc/kg wet weight for lead and 399 pc/kg wet weight for polonium. Using the data presented and making certain assumptions, removal times from the upper mixed layer were calculated to be about 5 yr for lead-210 and 0.6 yr for polonium-210. (Bopp-NSIC)
W71-09856

RADIOACTIVITY CONTENTS IN SOME PLANKTON AND SEA WATER SAMPLES COL-

LECTED DURING THE PERIOD BETWEEN 1960 AND 1968,
Parma Univ. (Italy).
L. Tassi-Pelati, and C. Truilzi.
Energia Nucleare (Milan), Vol 16, No 5, p 311-320, 1969, 5 fig, 4 tab, 15 ref.

Descriptors: *Radioisotopes, *Plankton, *Protozoa, *Strontium radioisotopes, Potassium radioisotopes, Radium radioisotopes, Absorption, Oceans, Water pollution sources, Fallout, Water pollution effects.
Identifiers: Cerium radioisotopes, Europium radioisotopes, Manganese radioisotopes, Promethium radioisotopes, Antimony radioisotopes, Zirconium radioisotopes.

Accumulation of strontium-90 by Ligurian plankton containing the protoza Acantharia which has a skeleton containing SrSO4 and by Adriatic plankton containing no Acantharia was compared. A higher level of radioactivity in the Ligurian Sea than in the Adriatic was attributed to the uptake of strontium-90 by Acantharia. It was concluded that species of Acantharia are useful as strontium-90 indicators. Radioactivity in plankton in the northern Adriatic and Ligurian Seas from 1961-68 followed closely the fallout. Strontium-90, cerium-144, europium-155, manganese-54, promethium-147, antimony-125, zirconium-95, potassium-40, and radium-226 were measured by radiochemical methods in selected samples of plankton and seawater. It was concluded that plankton may be used as an immediate indicator of environmental contamination from radioactive fallout. (Bopp-NSIC)

WATER QUALITY INFLUENCES ON OUTDOOR RECREATION IN THE LAKE ONTARIO BASIN,
Bureau of Outdoor Recreation, Ann Arbor, Mich.
Robert J. Henley.
In: Proceedings, Tenth Conference on Great Lakes Research, Ann Arbor, Braun-Brumfield, Inc, 1967, p 427-440.

Descriptors: *Water quality, *Recreation, *Swimming, *Water pollution effects, Bacteria, Algae, Fish, Sewers, Runoff, Wastes, Water supply, Effluents, Streams, Lakes, Rivers, Reservoirs, Boating, Euthrophication.
Identifiers: *Lake Ontario, Water turbidity, Industrial plants, Water sports.

The relationships between water quality and the uses of recreational water resources in the Lake Ontario basin are surveyed. There is a discussion of water quality indices (high bacteria counts, algae masses, fish mortality and water turpidity). Recreation value of water is analyzed in light of the influence of poor water quality on swimming, with particular attention to situations in which swimming has been banned by public officials. The value of pollution control to such water recreation is stressed. Predictions are made for the future demand of the public for swimming and other water-related recreation activities and indications point to an increase in this demand. (Murphy-Rutgers)

5D. Waste Treatment Processes

REMOVAL OF RADIOISOTOPES FROM LIQUID WASTES BY SORPTION IN LOCAL MINERALS,
Atomic Research Centre, Bombay (India).
U. Chandra.
Availability: NTIS. BARC-454, 1970. 29 p.

Descriptors: *Waste disposal, *Waste water treatment, Radioactive waste disposal, Water pollution sources, Absorption, Clays, Ion exchange, Cesium.
Identifiers: India.

Various naturally occurring minerals available in India have been extensively investigated for their suitability for treatment of radioactive liquid wastes at Trombay. Four general classes of sorbents were taken up for study and chiefly among the minerals are, Vermiculite, Attapulgite, Bentonite, and Lignite type coal products. It is concluded that though Vermiculite has been widely used as fixed bed ion exchange material, Attapulgit too is a very potential mineral because of its exceptionally high selectivity for radiocesium even in presence of macro amounts of inactive sodium in the waste solutions. REUSE OF CHEMICAL FIBER PLANT WASTE WATER AND COOLING WATER BLOWDOWN,
Fiber Industries Inc., Charlotte, N.C.
William J. Day.
Copy available from GPO Sup Doc as EP2.10:12090EOX10/70, $0.70; microfiche from NTIS as PB-200 695, $0.95. Water Pollution Control Research Series, October 1970. 66 p, 15 fig, 5 tab, 15 ref. EPA Grant No WPRD-100-01-68, Program No 12090 EUX 10/70.

Descriptors: *Water reuse, *Domestic wastes, *Industrial wastes, Activated sludge, Trickling filters, Lagoons, Tertiary treatment, Activated carbon, Flocculation, Algae, Sludge, Chromium, Toxicity, Neutralization, Hydrogen ion concentration, Temperature, Biochemical oxygen demand, Chemical oxygen demand, Cooling towers, *Waste water treatment.
Identifiers: *Micro screening.

Waste waters from a Fortrel Polyester manufacturing plant consisted of organic chemical process wastes, cooling system blowdown, and sanitary wastes from the plant. A water reuse program was instituted which consisted of: (1) pretreatment of cooling waters for removal of heavy metals; (2) in-plant modifications and additions to the existing system to increase treatment plant capacity; and (3) a post treatment system for effluent polishing prior to selected reuse. The final system consisted of: (1) a chromate reduction unit rated at 120 gpm for concentrations of up to 300 mg/l CrO4 and designed for continuous operation; (2) equalization basins having a combined capacity of 195,000 gallons and containing sufficient mixing capacity to prevent short-circuiting and stratification; (3) a plastic media roughing filter consisting of two tiers of poly-vinyl chloride media 10 feet thick and 25 ft in diameter; (4) an aeration basin equipped with 175 hp of aeration and mixing capacity and using 100% recycle of clarifier sludge; (5) a peripheral flow type clarifier; (6) two series connected polishing ponds; (7) a micro screen or algae screen; (8) a flocculant and/or carbon unit; (9) a sludge pond; and (10) a digester. Chromium was removed from the cooling tower blowdown for $.21 per pound of chromate removed. The plastic media trickling filter, used as a roughing filter, provided 40% BOD removal over a wide range of loading rates. The 0.33 mgd industrial and domestic waste water was treated and reused at a rate of 0.10 mgd for approximately 40 cents/1000 gallons. (Lowry-Texas)

Copy available from GPO Sup Doc as I67.13/4:17090 FTA 7/69, $0.70; microfiche from NTIS as PB-200 721, $0.95. Water Pollution Control Research Series, July 1969. 70 p, 3 fig, 3 tab, 18 ref. FWQA Contract No 14-12-410, Program 17090 FTA 07/69.

Descriptors: *Computer simulation, *Mathematical models, Feasibility studies, Cost analysis, Electrodialysis, Separation techniques, Membrane processes, Semipermeable membranes, Anions, Cations, Demineralization, Desalination, Resistivity, Flow, Acid, Storage, Instrumentation, Pipes, Pumps, *Waste water treatment.

An electrodialysis unit was established as a control volume, and material balances around the control volume were formulated, involving input and output flows, types of charged particles to be exchanged, concentrations of charged particles, and percentage removal of individual ions as well as percentage removals of total ions. Significant parameters involved included spacer design geometry, membrane properties (resistivity, current efficiency, separation factors, etc.) and mode of operation of the stack (current density, products stream concentration, waste/product ratio, waste stream pH, etc.). Performance equations were then formulated for resistivity, D.C. power input, current efficiency, number of stacks required, and the pumping headloss. Cost analyses were then derived to include: (1) electrodialysis stacks, stack piping, distribution piping, and pumps for stack related costs; (2) rectifiers and process electrical for D.C. power costs; and (3) acid storage tanks, acid feed pumps, instruments, and miscellaneous equipment for auxiliary costs. Equations derived for capital costs were based on the January 1965 Engineering News-Record cost index. Operational costs were estimated and evaluated in the same manner. The program was run for plants of 1, 10, and 100 MGD, with capital and operating costs being $164,620 and 7.07 cents/1000 gallons respectively for a 1 MGD plant. Program flow charts as well as actual computer outputs are presented. (Lowry-Texas)

AEROBIC SECONDARY TREATMENT OF POTATO PROCESSING WASTES.
French (R. T.) Co., Shelley, Idaho.

Copy available from GPO Sup Doc as EP.2.10:12060 EHV 12/70, $1.50; microfiche from NTIS as PB-200 623, $0.95. Water Pollution Control Research Series, Dec 1970. 110 p, 68 fig, 5 tab, 13 ref. EPA Grant No WPRD 15-01-68, Program No 12060 EHV 12/70.

Descriptors: *Potatoes, *Industrial wastes, Activated sludge, Cost analysis, Technical feasibility, Economic feasibility, Aeration, Temperature, Alkalinity, Hydrogen ion concentration, Organic loading, Kinetics, Chemical oxygen demand, Biochemical oxygen demand, Dissolved oxygen, Chlorination, Disinfection, Coliforms, Sludge, Vacuum drying, Dewatering, *Waste water treatment.
Identifiers: *Food processing, Suspended solids.

The R. T. French Company, of Shelley, Idaho, has demonstrated the feasibility of using a complete mix activated sludge unit for secondary treatment of potato processing wastes. During the 1969-1970 processing season, both the activated sludge process and a flow through aeration process without secondary clarification were studied. The activated sludge unit was demonstrated to be capable of BOD removals, in excess of 90% over extended periods, with coliform removals in excess of 96%. With the flow through system, BOD removals ranged between 70 and 80%. Analysis of data obtained revealed that both the quantity of excess sludge produced and the amount of oxygen required were functions of the BOD removal rate and the mixed liquor volatile suspended solids concentration. The substrate removal rate coefficient was shown to be temperature dependent. The prevailing low air temperatures at the Shelley location did not cause system failure, but data obtained demonstrated the need to consider temperature loss in system design. Total annual treatment costs, excluding costs for waste activated sludge disposal, were estimated to be $.038 per lb BOD applied, and $.021 per lb COD applied. Operation of thickener-clarifier on combinations of silt and biological solids was not successful. Failures with this unit demonstrated a need for the development of special silt removal and handling equipment for potato processing. (Lowry-Texas)

A TECHNIQUE FOR IRRIGATING BOTTOM LAND HARDWOOD TREES WITH PAPERMILL EFFLUENT IN NORTH LOUISIANA,
Louisiana Polytechnic Inst., Ruston.
Ishtiaq Ahmed.
Masters Thesis, May 1970. 68 p, 2 fig, 6 tab, 43 ref. OWRR Project A-013-LA (1).

Descriptors: *Pulp and paper industry, *Irrigation, Industrial wastes, *Water reuse, Trees, Hydrologic cycle, Plant growth, Evaporation, Evapotranspiration, Interception, Precipitation (Atmospheric), Runoff, Storage, Temperature, Sampling, Color, Turbidity, Cost analysis, Waste water treatment.

Bottom land hardwood trees in Louisiana were irrigated with both black water and white water effluents from local papermills. Analyses were performed on the waters to determine the individual constituents and characteristics of each. White water was found to be predominantly sodium, while the major component of black water was found to be sodium bicarbonate. Average annual precipitation for the area was found to be 53 inches per year. Tests were conducted which established 19.3 inches/year the maximum permissible amount of mill effluent, mixed 9 parts of white water to 1 part of black water, which could be used to irrigate the forests to obtain optimum growth. The optimum growth recorded was 6.03% per year. Trees would be irrigated from April through September, the time when most tree growth occurs. Based on a life expectancy of 20 years, the cost of the project was determined to be $7.43 per acre per year. Further research is needed in the form of a tree improving program to determine the optimum tree species for this particular application. Varying proportions of white water to black water should also be experimented with in order to achieve optimal conditions throughout the system. (Lowry-Texas)

WATER FILTRATION OPTIMIZATION BY GEOMETRIC PROGRAMMING,
Texas A and M Univ., College Station. Dept. of Industrial Engineering.
Duane J. Wray.
MS Thesis. 54 p, 4 fig, 55 ref. OWRR Project A-011-TEX (3).

Descriptors: *Filtration, *Operations research, Mathematical studies, *Optimization, Flow, Headloss, Sands, Waste water treatment.
Identifiers: *Geometric programming, *Multimedia beds, Backwash.

Water filtration has been prepetuated since its conception by mainly 'rule of thumb' design with little mention made of actual determination of mechanisms by which filters work. Therefore, designs have been of the classical form, conforming not to economics or performance, but to tradition. Establishment of the various operational parameters has allowed the process to become amenable to economic optimization by the method of geometric programming. The method was applied to multi-media filters where the primary variables were: (1) depth of each media; (2) flow rate; (3) length of filter run; (4) head loss; and (5) equivalent grain diameter. Primary costs included original media cost amortized over a specified period, and the cost of the backwash water. A sample problem was analysed using the geometric programming method. The values used were those which could conceivably be from a typical plant. The ease with which the sample problem was analyzed demonstrated the feasibility of the method as a practical design tool for engineers. The use of computers for performing the calculations would make geometric programming even more attractive, and work is continuing along those lines. (Lowry-Texas)

THE EFFECT OF IRRIGATION WITH MUNICIPAL SEWAGE EFFLUENT AND SLUDGE ON SELECTED TREES, GRASSES, AND LEGUMES PLANTED IN BITUMINOUS STRIP-MINE SOIL,
Pennsylvania State Univ., University Park. Dept. of Forestry and Wildlife.
John Allen Dickerson.
Master's Thesis, Mar 1971. 88 p, 26 fig, 18 tab, 21 ref. OWRR Project B-020-PA (5).

Descriptors: *Strip mine wastes, *Acid mine water, *Vegetation establishment, Municipal wastes, Sludge, Water reuse, Trees, Grasses, Fescues, Germination, Mortality, Acidity, Hydrogen ion concentration, Alkalinity, Toxicity, Temperature, Monitoring, Sampling, Percolation, Pennsylvania.
Identifiers: *Survival.

Many areas of Pennsylvania are covered with harsh bituminous spoils which have repeatedly resisted revegetation because of the toxicity of the spoil banks. 10 boxes each holding 512 cu ft or approximately 25 tons of material, were filled with spoil material from the Lower Kittanning bituminous coal seam. These boxes were then irrigated with municipal sewage plant effluent and sludge. The boxes were planted with seven tree species, two grass species, and two legume species with random arrangement. The 10 boxes were paired for weekly irrigation with sludge and effluent as follows: (1) control (no irrigation); (2) two inches effluent; (3) one-inch effluent and one-inch sludge; (4) two inches effluent and two inches sludge; and (5) 2 inches sludge. Temperatures, soil moisture content, and percolate quality were monitored for a 24 week period. Results of these tests showed that black locust trees had a survival rate overall of 90% and white pine trees had a survival rate of 74%. These factors combined with the excellent' growth of both orchard grass and tall fescue suggested that municipal sludge and sewage effluent can help to ameliorate harsh conditions found on bituminous spoil banks. The spoil material used in this study had resisted conventional revegetation for 23 years, due mainly to highly acid (pH less than 3.0) and toxic conditions. (Lowry-Texas)

SURVEY OF TREATMENT AND RECYCLE OF USED FISH HATCHERY WATER,
New Mexico State Univ., University Park. Dept. of Civil Engineering.
John Burkstaller, and R. E. Speece.
New Mexico State University, Engineering Experiment Station, Technical Report No 64, June 1970. 41 p, 5 fig, 1 tab, 24 ref. WRRI Project A-018-NMEX (2).

Descriptors: *Fish hatcheries, *Water reuse, Temperature, Hydrogen ion concentration, Dissolved oxygen, Ammonia, Fish toxins, *Waste water treatment, Adsorption, Activated carbon, Catalysts, Filtration, Nitrification, Disinfection, Chlorine, Ozone, Ultraviolet radiation, Microorganisms, Viruses, E Coli, Fish diseases, Toxicity, Monitoring, Enzymes.
Identifiers: Bromine.

Re-use of fish hatchery water is becoming more attractive for the following reasons: (1) many water supplies are too cold and must be heated, and on a once through basis all heat remaining is wasted; (2) many areas do not have sufficient water supplies to raise full capacities of fish during dry months, and (3) spatial limitations are also becoming increasingly prevalent. Problems encountered in recycling

of hatchery water include: (1) smaller fish are much more susceptible to certain fish diseases and recycle can take disease producing organisms from older fish and start an epidemic among the younger fish; (2) ammonia is extremely toxic to fish even in very small amounts, and therefore, it must be removed from the water before re-use; and (3) for growing cold water fish, recycle water may become unsuitable since it eventually warms to the temperature of the surroundings. Various treatment methods tested to alleviate these problems include the use of ultraviolet light, chlorine, bromine, chlorine-bromine combinations, and the suggested use of ozone for disinfection. Use of these methods, however, would require additional treatment for residual removal. A typical installation involving U-tube aeration, biological filters for nitrification, and continuous monitoring of pH, D.O. and temperature is presented. (Lowry-Texas)

THE ROLE OF THE ENZYME 1-PHOSPHOFRUCTOKINASE IN THE METABOLISM OF CLOSTRIDIUM PASTEURIANUM W5,
National Inst. for Water Research, Pretoria (South Africa).
J. P. Kotze.
Water Research, Vol 3, 1969, p 83-91. 1 fig, 3 tab, 26 ref.

Descriptors: *Anaerobic digestion, *Anaerobic bacteria, Clostridium, Enzymes, Metabolism, Microorganisms, Hydrolysis, Degradation (Decomposition), Protein, Analytical techniques, Oxidation-reduction potential, Spectrophotometry, Chromatography, Sampling, Waste water treatment.
Identifiers: *Adenosine tri-phosphate, *Adenosine di-phosphate, Absorbance, Buffer, Glucose.

Clostridia have been shown to be the most numerous species of organisms in anaerobic digesters. Many attempts have been made to establish the exact mechanisms by which anaerobic degradation takes place. The metabolic pathways were examined for Clostridium Pasteurianum W5 by analyzing cell-free samples for enzymatic activity. Cl. Pasteurianum W5 has been documented concerning its lack of 6-Phosphofructokinase, and a new metabolic shunt to circumvent this lack of 6-PFK activity in the glycolytic degradation of carbohydrates has been proposed. Cl Pasteurianum W5 was studied in pure culture to allow the sequence of the metabolic pathways to be more easily detected and studied. Glycose, fructose, mannitol, and sorbitol were used as substrates. Thin layer chromatography and spectrophotometric methods were utilized to detect small concentrations of enzymes. Hexose and hexitol degradation was found to proceed through the use of a 1-phosphofructokinase and mannitol-1-phosphate dehydrogenase shunt mechanism, while the lack of 6-phosphofructokinase had no significance. This work more fully elucidated the actual pathways by which anaerobic digestion proceeds in the clostridia, but further investigations continue. (Lowry-Texas)

AEROBIC HETEROTROPHIC BACTERIAL POPULATIONS OF SEWAGE AND ACTIVATED SLUDGE, IV. ADAPTATION OF ACTIVATED SLUDGE TO UTILIZATION OF AROMATIC COMPOUNDS,
Rutgers - The State Univ., New Brunswick. Dept. of Environmental Sciences.
T. B. S. Prakasam, and N. C. Dondero.
Applied Microbiology, Vol 19, No 4, p 663-670, Apr 1970. 3 fig, 4 tab, 15 ref. FWQA Program 17050 DFL 04/70.

Descriptors: *Enzymes, *Aromatic compounds, Sewage, *Viability, Population, Aeration, Acclimatization, Nutrients, Heterogeneity, Biochemical oxygen demand, Filtration, Phosphates, Chlorides, Sulfates, Activated sludge, Waste water treatment.
Identifiers: *Enzyme repression, Stainer's technique, Glucose.

An activated sludge from a sewage treatment plant and a laboratory activated sludge developed on an artificial waste were compared for their ability to utilize 11 aromatic compounds. The settled sewage from a treatment plant in Marlboro, New Jersey was used as an inoculum to develop activated sludges in a laboratory. Mixed liquor from aeration tanks was used as authentic activated sludge the artificial waste consisted of nutrient broth solids, glucose and salts. Sludge extract media was prepared by autoclaving 250 ml of the mixed liquor suspended solids acclimated to particular aromatic compound at 121 deg C for 15 minutes. Oxygen uptake was studied by usual monometric techniques, using constant volume respirometers and 15 ml flasks with 0.2 ml of 15% (w/v) KOH at 20 deg C. A sample of laboratory grown activated sludge unacclimated to aromatics and another mixed liquor from Marlboro sewage treatment plant were plated on artificial wastes. There were marked differences in numbers of organisms able to utilize the various aromatic compounds. After 3 weeks visible counts of sludges were between 286-354 million/ml. Counts for laboratory activated sludge were higher on all media, than corresponding counts for treatment plant activated sludge. (See also W71-09533) (Lowry-Texas)

AEROBIC HETEROTROPHIC BACTERIAL POPULATIONS OF SEWAGE AND ACTIVATED SLUDGE. V. ANALYSIS OF POPULATION STRUCTURE AND ACTIVITY,
Cornell Univ., Ithaca, N.Y. Dept. of Food Science.
T. B. S. Prakasam, and N. C. Dondero.
Applied Microbiology, Vol 19, No 4, p 671-680, Apr 1970. 2 fig, 7 tab, 17 ref. FWQA Program 17050 DFL 04/70.

Descriptors: *Activated sludge, *Aromatic compounds, Heterogeneous populations, Systematics, Frequency, Flocculation, Diversion, Oxidation, Sewage, Waste water treatment.
Identifiers: *Catechol sludge, *Artificial waste, *Microbial populations, Benzoate, Substrate utilization ability index, Oxidation index.

The confidence interval method and mountford's index were tested in analyses of the microbial populations of 11 laboratory activated sludges acclimated to aromatic compounds. The gross and microscopic differences between the sludges acclimated were strongly indicative of profound changes during the adaptation of laboratory sludge. The microscopic populations were present in higher numbers in heterologously acclimated sludges than in homologously acclimated sludges. To evaluate the abilities of the bacteria and the oxides of the aromatic substrates a 'Substrate utilization ability index' (SUAI) was computed and compared with an 'Oxidation index' (OI). A high OI value indicated sludge had ability to oxidize corresponding substrates to a high degree. The sludges are compared to one another in a series of pairs accounting for bacterial types and frequencies. From the data compiled confidence limits around the mean (y) of the total differences were calculated and the level of significance was chosen at 10%. Analysis by Mountford's method provided quantitative comparison over the entire set of sludges and any desired groupings through the lowest common similarity values. Attempts at population analyses indicated each acclimated sludge differed greatly in microbial constitution. Analyses of the data by a statistical method used quantitative and objective evidence that the resulting populations were quite divergent in their microbial composition during the period of investigation. In retrospect, the need of further tests of the sensitivity of methods of population analysis of bacteria is evident. (See also W71-09532) (Lowry-Texas)

SYMPOSIUM-FIELD EVALUATION OF LAS AND ABS TREATABILITY.
Proctor and Gamble Co., Cincinnati, Ohio. Sanitary Engineering Research Services.

Proceedings, Industrial Waste Conference, 21, Vol L, No 2, p 724-756. 20 fig, 4 tab, 6 ref.

Descriptors: *Alkybenzene sulfonates, *Linear alklate sulfonates, *Biodegradation, *Detergents, *On-site tests, Surfactants, Biochemical oxygen demand, Chemical oxygen demand, Sewage treatment, Waste water treatment, Ohio, Virginia, Wisconsin.
Identifiers: Columbus (Ohio), Woodbridge (Virginia), Manassas (Virginia), Plymouth (Wisconsin).

Four carefully documented on-site tests conducted at sewage treatment facilities evaluated the biodegradability of a new detergent surfactant, linear alkyl sulfonate (LAS), and compared its biodegradability to that of alkyl benzene sulfonate (ABS). Each study was carried out under the supervision of a different university and all found LAS-based detergent products were much improved in degradability over ABS products in similar operating conditions. Other significant conclusions were: (1) efficiency of LAS removal depended upon the efficiency of BOD removal, i. e., a system with 80 to 90% BOD removal could expect to degrade 80 to 90% of LAS, (2) effluent concentrations of active substance from an aeration-type treatment were reduced to 1-2 mg/l after changing to the use of LAS-based products, and (3) under corresponding conditions of 12 hour detention period and mixed liquor suspended solids of around 1500 parts per million, LAS removal was 70% compared to 30-50% for ABS. Graphs and data may be useful in the operation, treatment, and the design of new plants when LAS-based products come into general use. (Burdette-Texas)

ON IMPROVING WASTE WATER QUALITY,
Mobil Oil Co., East Chicago, Ind.
J. A. Hart.
Water and Sewage Works, Vol 117, No 9, Sept/Oct 1970, p IW/20-IW/26. 3 fig, 3 tab, 1 ref.

Descriptors: *Pollutants, *Waste water treatment, Oxidation, Effluents, Flocculation, Biochemical oxygen demand, Chlorination, Chemical oxygen demand, Indiana.
Identifiers: *Air-flotation, *Stripping, Sour-water, Great Lakes-Illinois River Basin Survey (GLIRB), Influent, Polyelectrolyte.

In February, 1965, a sour water stripper was put into service at Mobil Oil Company's East Chicago Refinery located on the Indiana Harbor Ship Canal. As a result the water's visual appearance was improved by the elimination of a black precipitate caused by sulfides. Sour water stripper's bottoms were of excellent quality containing essentially no sulfide, only 15 mg/l of ammonia-nitrogen and their reuse achieved a phenol reduction of 90%. In July, 1967 new criteria for the Indiana Harbor Ship Canal were restricted to require additional improvement in the quality of Mobil's wastewater effluent. It appeared that treatment should be provided for reducing oil content, suspended solids, phenols, ammonia-nitrogen and BOD. Another major objective was to improve the water's quality to permit further reuse as makeup in the refinery's cooling towers, reducing effluent volume and offering possibilities of reducing phenol and BOD. The objectives were all met by installing an air-flotation unit as a secondary treatment process. The results of the unit showed that a polyelectrolyte should be used to obtain the best possible water quality for reuse as cooling tower make-up. Before completion of the air-flotation installation several tests were run to determine effects of changing sour water stripper bottoms to cooling towers. The results indicated the existence of an environment in the cooling towers favorable for oxidizing phenols. No odors which would cause air pollution were de-

tected in the air leaving the cooling towers. (Lowry-Texas)

DESIGN GUIDES FOR BIOLOGICAL WASTE WATER TREATMENT PROCESSES-LABORATORY STUDIES OF THE PERFORMANCE OF THE CONTACT STABILIZATION PROCESS,
Texas Univ., Austin. Center for Research in Water Resources.
Donnie W. Berryhill, Joseph F. Malina, Jr., and Rolf Kayser.
Technical Report EHE-70-16, CRWR-62, Texas University, Austin. 55p. FWQA Grant No WPRD 178-01-68.

Descriptors: *Activated sludge, *Organic loading, Biochemical oxygen demand, Aeration, Dissolved oxygen, Mixing, Acclimatization, Sampling, Sludge, Municipal waste water, *Waste water treatment, Texas.
Identifiers: *Contact stabilization, Suspended solids, Detention time, Oxygen uptake, Austin (Tex).

Laboratory scale tanks being fed 4 l/hr of waste water containing 100 mg/l Total BOD were operated as contact stabilization tanks. Volume of the stabilization tank was held constant at 4 liters throughout the experiment, while volume of the contact tank was varied between 1/2 and 4 liters. Organic loadings ranged from 0.31 to 0.72 lbs BOD per pound total suspended solids per day, with removal rates ranging from 0.24 to 0.51 lb BOD lb TSS/day. One run was made with the system operated as a complete mix activated sludge unit. At loadings of 1.04 lb BOD/lb MLSS, .91 lbs/BOD/lb MLSS/day were removed. A dissolved oxygen probe attached to a battery powered mixer was used to measure oxygen uptake rates, which varied from 43 to 191 mg/l/hr in the contact stabilization units, and from 123 to 186 mg/l/hr in the activated sludge units. Short contact periods of from 10 to 15 minutes were sufficient to reduce the soluble BOD in the waste water to low levels, but substrate removal limits were not exceeded in any of the runs. Therefore, no minimum contact or stabilization periods could be established. Further oxygen studies using the prescribed testing procedures should be performed to supplement the data obtained. (Lowry-Texas)
W71-09536

ACCELERATED DIGESTION OF CONCENTRATED SLUDGE,
Mississippi State Univ., State College. Dept. of Sanitary Engineering.
Adnan Shindala, Joseph V. Dust, and Alvin L. Champion.
Water and Sewage Works, Vol 47, No 9, p 329-332, Sept 1970. 2 fig, 3 tab, 16 ref.

Descriptors: *Digestion process, *Sewage, *Sludge, Anaerobic digestion, Economics, Alkalinity, Hydrogen ion concentration, *Waste water treatment.
Identifiers: *Thickening, Volatile acids, Temperature.

A study was made of the digestion of concentrated domestic sludge. The purpose of the investigation was: (1) to determine successful digestion of thickened sludge; and (2) to evaluate optimum solids concentrations combined with optimum digestion periods that would produce acceptable volatile solids reductions. Sludges tested with solid concentrations of 5, 15, 25, and 35% were digested for loading periods of 30, 20, 15, and 10 days under constant mesophillic temperature conditions and displacement loadings. Digested sludge with a volatile matter content of 44% was used to start digesters. Conditions inside the digesters were checked every 4 days. Raw sludge used was concentrated to 15%, 25% and 35%. A sludge volume of 1/2 1 was used, and temperature was maintained between 92 deg and 95 deg F. The following parameters of the added sludge were known: (1) weight, (2) percentage of solids and (3) percent of volatile matter. Several factors were observed in order to avoid digester failure: (1) pH, (2) alkalinity, (3) volatile acids and (4) temperature of digestion. With these factors in mind the following control tests were performed on sludge: (1) volatile acids, (2) pH, (3) total alkalinity, (4) volatile solids and (5) total solids. The results showed that concentration had a definite effect upon digestion. Percentage reduction and volatile matter decreased with increased concentration for all loadings. From the data compiled during this study, the following conclusions are drawn: (1) volatile acids and alkalinity increased with increase in solids concentration, (2) pH remained constant indicating pH was not a function of the increase in solids concentrations as long as alkalinity to volatile acids ratio was more than 1, (3) 15% solids produced maximum amount of gas per liter of sludge but 5% produced the most gas per unit of dry solids, (4) The percent reduction in volatile solids decreased with the increase in solids comcentration, and (5) loadings of concentrated sludges up to 10 mg/day produced an acceptable volatile solids reduction. (Lowry-Texas)

USE OF SOIL TO TREAT ANAEROBIC LAGOON EFFLUENT: DESIGN AND OPERATION OF A FIELD DISPOSAL SYSTEM,
Iowa State University, Ames. Dept. of Agricultural Engineering.
Dale H. Vanderholm, and Craig E. Beer.
Transactions of the ASAE, Vol 13, No 5, Sept-Oct 1970, p 562-564, 2 fig, 2 tab, 17 ref.

Descriptors: *Water reuse, *Irrigation, Farm wastes, Percolation, Infiltration, Lagoons, Organic loading, Rates of application, Aeration, Nitrification, Ammonia, Leaching, Sampling, Monitoring, Laboratory tests, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Nitrates, Phosphates, Chlorides, Odor, Insects, Waste water treatment.

12 individual plots of land, each 45 ft x 60 ft were subjected over a 6 month period to intermittent irrigation with effluent from an anaerobic lagoon. The design included: (1) a portable agricultural irrigation system; (2) an adequate drainage system to maintain favorable moisture conditions in the soil profile; (3) a sampling system and procedure to monitor system performance; and (4) measurement devices for inflow, outflow, and pertinent climatic data. Available moisture content (AM) was the criterion used to determine irrigation frequency. A .30 inch per hour application rate was used. Larger rates resulted in ponding and excessive runoff. Samples of the influent were obtained by placing catch pans on the field, while effluent samples were obtained from the sumps in the tile drains. Samples were analyzed for BOD, COD, pH, nitrogen, chlorides, and phosphates. No odor problems or insect nuisance problems developed. No noticable corrosion or clogging problems were experienced in the irrigation equipment. COD, nitrogen, and phosphorus removals averaged 97%, 80%, and 99..% respectively. Chloride was not removed and hence no build-up problems were predicted. This method has been shown to be feasible for treating agricultural wastes, but design criteria depend upon individual conditions, and must be evaluated for each individual case. (Lowry-Texas)

A PRELIMINARY 'LEAST COST' STUDY OF FUTURE GROUNDWATER DEVELOPMENT IN NORTHEASTERN ILLINOIS,
Illinois State Water Survey, Urbana.
A. F. Moench, and A. P. Visocky.
State of Illinois Department of Registration and Education, Circular No 102. 19 p, 10 ref.

Descriptors: *Water requirements, *Illinois, Aquifers, Groundwater, Dolomite, Sands, Gravels, Hydrology, Water utilization, Water management (Applied), Water purification, Cost analysis, Amortization, Waste treatment.

Lake, McHenry, DuPage, Cook, Kane, and Wi Counties in Illinois were analyzed for projecte groundwater usage from 1980 to 2020. Three mai groundwater sources of these areas are: (1) shallo sand and gravel aquifers, (2) shallow dolomit aquifers, and (3) deep sand stone aquifers. Pump age from the shallow aquifers was limited to the known potential yield, but no limit was set for th deep aquifers until such time as the water level fe below the top of the main producing aquifer, which time a rate which produced a constant wate level would be mandatory. Unit costs at well pumps, power, and rehabilitation were estimate and amortized at 6% (in 1970 dollars). Treatmen costs for such treatment as would achieve the sam finished quality as treated Lake Michigan wate were also included. Raw water costs were projecte to vary between 2 and 14 cents/1000 gal dependin upon the depth at the aquifer. Treated water co estimates varied from 22 to 53 cents/1000 gal. townships were found to be deficient in ground water in 2020 by 147 mgd. This advance indicatio allowed the search for alternate water supplies begin long before the shortage became critica (Lowry-Texas)

CARNIVOROUS PLANTS IN ACTIVATE SLUDGE,
Northwestern Univ., Evanston, Ill.
Wesley O. Pipes.
Proceedings, Industrial Waste Conference, 20, V XLIX, No 4, p 647-656, July 1965, 6 fig, 1 tab, ref.

Descriptors: *Rotifers, *Nematodes, *Activat sludge, *Fungi, Sewage, Aeration, Nutrients, A toclaved, Spores, Animal parasites, Waste wat treatment.
Identifiers: *Zoophagus, Hyphae, Organelles, Ag cultures.

The Sanitary Engineering Research Laboratory The University of California, Berkeley prepared study concerned with the predatory fungi fou growing in activated sludge. The fungi derives sustenance by consuming rotifers and nematod believed to play a part in the breakdown of was organic matter and the formation of activat sludge flocs occasionally responsible for bulkin All samples of activated sludge examined predatory fungi were obtained from an experime tal pilot plant at The University. Aeration tan used had a capacity of 600 gallons and treated s tled domestic sewage at aeration times of abou hours. Four methods were employed to study t problem: (1) microscopic observations were us when large numbers of predatory fungi were to found, (2) enrichment culture techniques we preferred for fungi in small numbers, (3) isolati was used in pure cultures using conventio mycological techniques, (4) studies on bulki confirmed that predatory fungi isolated in pure c tures and then transferred to autoclaved sewa would grow in sewage saprophytically. Resu showed fungus was characterized by non-separa hyphae, 6-8 microns in diameter with short later branches. The fungus was undoubtedly the sa one found by Cooke and Ludzack in laboratory tivated sludge culture fed on synthetic industr waste identified as Zoophagus Insidia Zoophagus does not grow in autoclaved sewa Reports established that predatory fungi do occ in activated sludge treating domestic sewage i continuous-flow system. FERMENTATION WASTE DISPOSAL IN GREAT BRITAIN,
Borthwick (Thomas) Distillers Co. Ltd., London (England).
C. J. Jackson.
Proceedings, Industrial Waste Conference, 21, Vol L, No 2, Mar 1966, p 19-32. 8 tab, 11 ref.

Descriptors: *Fermentation, *Effluents, *Evaporation, *Oxidation, Sludge disposal, Filtration, Distillation, Waste water treatment, Estuaries, Microorganisms, Biochemical oxygen demand, Sewage, Waste disposal.
Identifiers: 'Flocor' installation, 'Polygrid' installation, Dilution, Treatability, Malts, Grains.

In fermentation industries microorganisms are utilized under controlled conditions to produce an end product. The microorganisms need an adequate nutrient medium resulting in a strong effluent after the removal of the main product. The problems in treating distillery effluents are determined by an optimization of 3 factors: (1) legal requirements, (2) technical feasibility and (3) economics and amenities. Since discharge of effluents to rivers and sewers is controlled, some degree of treatment is necessary. The most commonly used methods of treatment are: (1) to the sea and land, (2) precipitation by pH adjustment, (3) precipitation by chemical coagulation, (4) anaerobic decomposition, (5) aerobic decomposition, (6) combinations of aerobic and anaerobic and (7) evaporation/combustion. Before these methods can be considered certain questions are essential: (1) possibility of reducing volume of effluent, (2) is recycling possible with a consequent reduction in strength, (3) water recovery and recycling (4) if material removal from effluent can be sold or given away. Evaporation is the most commonly used method for receiving solids from effluent, but not always the most economical. TA 'Flocor' plant was tested in Scotland for treating condensate from evaporation of malt distillery spent wash. Mixture has BOD of 1,200 mg/l. Loadings on 3 stage unit are 5 lb/BOD/cu.yd/day and recirculation of 3:1 is used to provide wetting of filter elements. When the plastic filters were used results showed each stage loaded 5 lb/BOD/cu.yd/day removing 55% of load and effluent recirculation rate of 9:1. This performance indicated 'Flocor' installation would be more economical than conventional biological filters. (Lowry-Texas)

THE ECONOMICS OF REGIONAL POLLUTION CONTROL SYSTEMS,
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
Rolf A. Deininger.
Proceedings, Industrial Waste Conference, 21, Vol L, No 2, p 815-883. 11 fig, 1 tab, 12 ref.

Descriptors: *Waste water treatment, *Water quality, Economics, Systems analysis, Linear programming, Biochemical oxygen demand, Oxygen, *Water pollution control, *Regions, *Evaluation, Costs.
Identifiers: Mathematical formulation.

Investigations were carried out concerned with two main problems: (1) how treatment at various plants should be established to minimize total costs of waste treatment, and (2) consideration of the degree of treatment fixed and aspects of inter-community transfers of waste. The first problem compares costs with two schemes of pollution control: (1) where every with has some degree of treatment and (2) where upstream polluters are allowed to discharge as much waste as possible without violating water quality criteria set along the river. The main point made was that the costs of waste treatment increased approximately linearly for treatment range between 30% and 90% BOD removal, thus, there are 2 factors in the costs of water treatment: (1) decrease in costs with increase in size of plant and (2) increase in cost with increase in degree of treatment. Clearly, the economics of scale of waste treatment indicate that a joint treatment plant is more economical for 2 communities, than each having its own plant. It was also shown that the minimum cost solutions can guarantee the same degree of water quality as the equal treatment policy at much less cost. The influence of various parameters, such as river flow, temperature, and formations for inter-community sewer and treatment systems were also investigated. (Lowry-Texas)

TREATMENT OF WASTES FROM FOOD MANUFACTURE AND COFFEE PROCESSING,
Bostok, Hill and Rigby, Birmingham (England).
R. K. Chalmers.
Proceedings, Industrial Waste Conference, 22, Vol 1 II, No 2, July 1968, p 866-878, 1 fig, 4 tab, 4 ref.

Descriptors: *Industrial wastes, Organic wastes, Hydrogen ion concentration, Biochemical oxygen demand, Cost analysis, Evaporation, Separation techniques, Filtration, Centrifugation, Incineration, Screens, Temperature, Foods, *Waste water treatment.
Identifiers: *Food wastes, *Coffee, Custard powders, Jelly products, Dog food, Rice products, Weirs.

When an English General Foods factory was moved from a large city to a small town, it was faced with the need for a means of treating waste, especially from coffee manufacture, which could not be treated in the existing sewage disposal words at the new site, Banbury, Warwickshire. After investigating possible treatment methods, it was decided that physical means of reducing the effluent would be most advantageous. The treatment used was primarily based on segregation of the weak effluent and the strong effluent which contained the waste from the coffee plant. The essential components of the treatment unit are (1) strong and weak effluent collection pits, (2) storage tanks (3) duplicate evaporator feed tanks and a four-stage multiple evaporator for strong liquor treatment, (4) a weak effluent feed tank, duplicate hydro cyclones, pH correction tank, and a weir tank for weak effluent treatment, (5) duplicate centrifuges and two rotary vacuum filters for the grounds press effluents, (6) a paddle mixer, and incinerator boiler for the solids from the centrifuges, and (7) a segregation unit to divide the flow from the extraction columns. The product of the treatment was satisfactorily below the maximums set previously by Banbury authorities. The plant originally cost 220,000 Pounds with an operating costs of 50,000 Pounds per year. THE USE OF AERO-HYDRAULIC GUNS IN THE BIOLOGICAL TREATMENT OF ORGANIC WASTES,
Proctor and Redfern, Toronto (Ontario).
C. S. Dutton, and C. P. Fisher.
Proceedings, Industrial Waste Conference, 21, Vol L, No 2, March 1966. p 403-423, 7 fig.

Descriptors: *Oxidation lagoons, *Organic wastes, *Oxygenation, Aerobic treatment, Anaerobic conditions, Canneries, Activated sludge, Biochemical oxygen demand, Oxidation-reduction potential, Aquatic algae, *Biological treatment, *Waste water treatment.
Identifiers: Aero-hydraulic gun, Alliston (Ontario).

The aerated lagoon treatment of organic wastes is an economical and increasingly popular process. However, the degree of treatment has been limited by the nature of devices available for accomplishing oxygenation. Recent experiments utilized aero-hydraulic guns in simple aerated lagoons for treatment of organic wastes. The guns consisted of a polyethylene stack pipe, bubble generator, and an air supply that periodically released numerous small bubbles from the lagoon bottom. The resulting flow pattern of liquid from the lagoon bottom involved a strong radial current at the surface. Oxygenation capacity of the guns were derived in a series of curves that plotted lbs O2/hr against free air consumption. Correction factors permitted application of the curves to actual designs. A gun can also function as a positive sludge return pump by sealing up one of the ports and connecting a suction pipe. At a potato waste treatment facility in Alliston, Ontario, some 790,000 gpd of potato waste was discharged daily along with a load of 5,000 lbs BOD and a like amount of suspended solids. Recommendations for this facility were: (1) two conventional settling basins, each 24 ft square equipped with a sludge scraper, (2) a simple aerated lagoon equipped with 127 guns, and (3) two algae lagoons. Dr. C. P. Fisher studied the system and found BOD removal achieved by the aerated lagoon was approximately 90% with little or no measurable residual dissolved oxygen. There was no doubt that the thorough mixing produced by the guns was responsible to a greater or lesser degree for the high removals. Other studies were conducted on poultry and fruit canning wastes. THE ISOLATION AND CHARACTERIZATION OF SORBITOL-6-PHOSPHATE DEHYDROGENASE FROM CLOSTRIDIUM PASTEURIANUM,
National Institute for Water Research, Pretoria (South Africa).
P. J. DuToit, and J. P. Kotze.
Biochimica et Biophysica Acta, Vol 206, 1970, p 333-342, 8 fig, 4 tab, 8 ref.

Descriptors: *Enzymes, *Catalysts, *Inhibitors, Kinetics, Oxidation, Equilibrium, Analytical techniques, Laboratory tests, Separation techniques, Centrifugation, Isolation, *Electrophoresis, Hydrogen ion concentration, Chromatography, Spectrophotometry, Waste water treatment.
Identifiers: *Dehydrogenase, Enzyme activity, Buffer.

The procedure for isolating Sorbitol-6-P dehydrogenase included (NH4)2SO4 fractionation, DEAE cellulose chromatography (twice), Biogel P 60 gel filtration, and Sephadex G200 gel filtration. After purification of 176.5-fold, the enzyme carried a negative charge at pH 8.6, and was determined by electrophoretic mobility to consist primarily or one species having a molecular weight between 74,000 and 94,000. The purified enzyme was specific for cofactors NAD.. and NADH, and substrates sorbitol-6-P and fructose-6-P. Otpimum pH values of 8.5 and 10 were determined for the oxidation of sorbitol-6-P in Tris-HCl buffer and in glycine-NaOH buffer respectively. Michaelis-Menten constants Km and inhibitor constants K were determined for all reactants of sorbitol-6-P dehydrogenase. Kinetic constants for sorbitol-6-P and NAD.. had lowed numerical values for Tris-HCl (pH 8.5) than for glycine-NaOH (pH 9.8). The reduced reactants NADH and sorbitol-6-P had Km as well as Ki values, whereas the oxidized reactants, fructose-6-P and NAD.. displayed only Km values, while the Umax values of both reactions were influenced by the concentration of the oxidized reactants. The reaction (fructose-6-P ..NADH sorbitol-6-P ..NAD..) at pH 7.0 had an equilibrium constant of 3.81 x 10 to the 8th power M-1, indicating equilibrium as lying heavily on the side of sorbitol-6-P formation. (Lowry-Texas)

FOOD CANNERY WASTE TREATMENT BY LAGOONS AND DITCHES AT SHEPPARTON, VICTORIA, AUSTRALIA,
Melbourne Water Science Inst. (Australia).
C. D. Parker.
Proceedings, Industrial Waste Conference, 21, Vol L, No 2, March 1966, p 284-302, 5 fig, 13 tab, 6 ref.

Descriptors: *Canneries, *Industrial wastes, Peaches, Apricots, Pears, Citrus fruits, Tomatoes, *Aerobic treatment, *Anaerobic digestion, Biochemical oxygen demand, Activated sludge,

Cost comparisons, Sediments, Algae, Hydrogen ion concentration, Electric power, Sewage disposal, *Waste water treatment, *Oxidation lagoons.
Identifiers: Sheppartion (Australia), Oxidation ditches, Soup, Food wastes.

Cannery waste is characterized by high BOD and high acidity. The usual method of treatment is spray or flood irrigation or aerobic type lagoons with heavy dosage of sodium nitrate for odor control. In Shepparton, Victoria, expansions in the facilities of Shepparton Preserving Company, the largest cannery in the Southern Hemisphere, and the building of a soup cannery in the area caused problems in the treatment of the resulting sewage. There was a pressing need for an efficient means of purifying, without causing nuisance, the large seasonal flows of highly polluted food wastes from two canneries on areas closely adjacent to a prosperous and rapidly developing urban center. The short seasonal nature of cannery operations and consequent high capital cost made the problem even more difficult. It was decided to experiment with anaerobic and aerobic type lagoons and oxidation ditches. The waste from each firm is mixed with sewage plant effluent and treated in the new processing unit with very good results which are described in great detail. The total cost of the new unit, excluding the cost of inflow and outflow pipelines and labor and maintainence, was $155,000 to the Preserving Co., and $143,000 (American Dollars) to the soup cannery plus annual costs of $5,364 and $8,192 respectively, excluding pipelines, pumping stations, and maintainence labor. The net result was almost complete purification at costs the industries could accept. (Lowry-Texas)

THE EFFECT OF NITROGEN AND PHOSPHOROUS COMPOUNDS ON ONE OF THE MICROORGANISMS RESPONSIBLE FOR SLUDGE BULKING,
Toronto Univ. (Ontario).
Philip H. Jones.
Proceedings, Industrial Waste Conference, 20, Vol XLIX, No 4, p 297-315, July 1965, 12 fig, 8 tab, 30 ref.

Descriptors: *Sludge treatment, *Aquatic fungi, Carbohydrates, Molds, *Nitrogen, *Phosphorus, Analytical techniques, Activated sludge, Nutrient requirements, Water pollution sources, Waste water treatment.
Identifiers: *Sludge bulking, Geotrichum candidum, Nitrogen sources.

The term 'sludge bulking' refers to the development of poor settling properties in sludge and is defined as a biophysical response to some upset in the ecological balance of a mixed population of microorganisms. This phenomenon commonly occurs in municipal sewage-treatment plants where sewage which is rich in carbohydrates is found. Since such sewage is usually deficient in nitrogen and phosphorous, a study was undertaken to ascertain whether the microorganisms might actually become dominant due to the indirect effect of increasing BOD/N or BOD/P ratios. Evicence was sought to support the contention that a variety of filamentous microorganisms including Geotrichum candidum are closely associated with the sludge bulking phenomenon. Studies were done on a cross-section of organic and inorganic nitrogen sources when combined with a series of different carbon sources. Tests were also made to show the effect of allowing the concentration of inorganic phosphorous in an otherwise adequate medium. Several different phosphorus ratios were studied. Evidence obtained in these tests showed that in phosphorous or nitrogen deficient wastes, Geotrichum hold a competitive advantage over the microbial population as a whole. (Lowry-Texas)

INDUSTRIAL WASTES FROM SEAFOOD PLANTS IN THE STATE OF ALASKA,
Alaska Department of Health and Welfare, Juneau, Alaska.
Charles L. Jensen.
Proceedings, Industrial Waste Conference, 20, Vol XLIX, No 4, p 329-350, 18 fig, 15 ref.

Descriptors: *Industrial waste, *Fisheries, Commercial fishing, Salmon, Crabs, Shrimp, Organic wastes, Alaska, Saline water fish, Chemical reduction, Slurries, Sewage treatment, Waste water treatment, Alaska, Waste disposal.
Identifiers: Kodiac, Fish meal, Sole, Flounder, King crab, Tanner crab, Dungeness crab, *Seafood wastes.

The seafood industry in Alaska is faced with a growing problem due to the huge amounts of waste generated in the processing of seafood. In 1964, waste from salmon was approximately 103 million pounds, king crab waste was 69.5 million pounds, dungeness crab waste was 10 million pounds, shrimp waste was 5.5 million pounds, and halibut waste 3.4 million pounds. The total cost to the processors was $21 million. Changes in the fishing industry have lengthened operation time of processing plants from 50 calendar days to up to 200 days. The conclusion reached on examination of the given data is that (1) Alaska has a potentially dangerous pollution problem, and (2) great amounts of fish waste are being dumped into Alaskan waters which should be of use in the industry which reduces fish waste to meal. A paramount problem is the great distances between primary production points. Possible solutions to the problem include the establishment of a collection system serving the various production centers, necessitating the provision of a storage system to handle the build-up of waste. A variation of the plan calls for primary reduction centers at each of the processing sites. The plan is being studied, and although it has advantages, there are many problems to be worked out. The most probable method would be chemical reduction of the waste to a thick type of slurry, which then could be stored in oil tanks for eventual pumping into the barges or vessels, if the difficulties can be overcome. PRECIPITATION OF PHOSPHATES FROM WATER WITH FERROUS SALTS,
Ohio State Univ., Columbus. Dept. of Chemical Engineering.
Karlis Svanks.
Available from the National Technical Information Service as PB-200 822, $3.00 in paper copy, $0.95 in microfiche. Water Resources Center, Ohio State University, Columbus, Project Completion Report 347X, February, 1971, 150 p, 59 fig, 8 tab, 22 ref. OWRR Project A-011-OHIO (2).

Descriptors: *Phosphate removal, *Phosphates, Dissolved oxygen, *Chemical precipitation, Sedimentation, Flotation, Effluents, Sewage, Activated sludge, *Waste water treatment.
Identifiers: *Ferrous sulfate.

The use of ferrous sulfate for precipitating phosphate from water was investigated. Different phosphate containing solutions were evaluated: (1) pure orthophosphate, (2) secondary effluent from a waste treatment plant, and (3) precipitation of phosphate in a simulated activated sludge process. Determinations were made of the effect of dissolved oxygen concentration, pH, and iron-to-phosphate ratio on the removal of phosphate. The relative effectiveness of calcium hydroxide and sodium hydroxide for control of pH and the use of microflotation and dissolved air flotation for separation of the phosphate precipitate were evaluated. Maximum phosphate removal (up to 97 percent) was obtained when the pH was 7 to 8, the molar iron to phosphate ratio greater than 1.5 and dissolved oxygen concentration equal to that required for complete oxidation of ferrous iron. Calcium hydroxide was found to be a more effective base since the optimal pH range was expanded and the coagulation and flocculation of the insolubilized phosphates were improved. Interferences from organic matter in secondary effluents on flotation operations were observed. Ferrous sulfate should be very effective for removing phosphate in the activated sludge process. The low dissolved oxygen concentration will control the oxidation of ferrous iron to optimal rates, and the sludge will increase the settling rate of the phosphate precipitate.

ADVANCES IN WASTEWATER TREATMENT, PILOT PLANT, POMONA, CALIFORNIA.
Federal Water Quality Administration, Washington, D.C.; and Los Angeles County Sanitation Districts, Los Angeles, Calif.

(1969) 17 p, 14 fig.

Descriptors: *Pilot plants, *Water reuse, *Tertiary treatment, *Waste water treatment, *Sewage treatment, Activated carbon, Ion exchange, Electrodialysis, Reverse osmosis, Denitrification, Adsorption, Nutrients, Nitrogen, Phosphorus, Treatment facilities, California.
Identifiers: *Pomona (Calif), Los Angeles County, Nutrients removal.

The brochure describes the advanced waste treatment facility at Pomona, California, which was funded and staffed through the cooperation of the Federal Water Quality Administration and the County Sanitation Districts of Los Angeles County. The pilot plant receives a portion of the effluent from the conventional biological treatment facilities and investigates processes, and combinations of processes, to improve the quality of the water. The Sanitation Districts are particularly interested in advanced waste treatment processes which will produce reusable water. The plant provides conventional primary sedimentation and activated sludge treatment to approximately 10 mgd of waste water. The final effluent contains 10 mg/l of suspended solids, 5 mg/l of biochemical oxygen demanding materials, 45 mg/l of chemical oxygen demanding materials and 600-700 mg/l of dissolved salts. The initial effort at the pilot plant was directed toward developing technical and economic information on the granular carbon adsorption process for removing the dissolved organic contaminants remaining in the conventionally treated waste waters. In addition to carbon adsorption, the Pomona staff is working on ion exchange, electrodialysis, reverse osmosis, mineral addition to conventional processes to enhance phosphorus removal and biological denitrification. Each of these processes is described and illustrated. Operational efficiencies and costs are given. Removal of phosphorus and nitrogen, and the associated costs are described. (Poertner)

FEASIBILITY STUDY FOR GLENDALE - LOS ANGELES WATER RECLAMATION PLANT.
Engineering Science, Inc., Los Angeles, Calif; and Koebig and Koebig, Inc., Los Angeles, Calif.

March 13, 1969. 720 p, 89 fig, 123 tab, 75 ref.

Descriptors: *Water reuse, *Water pollution treatment, *Waste water, *Waste water treatment, *Water purification, *Beneficial use, *Reclaimed water, Industrial water, Planning, California.
Identifiers: *Los Angeles (Calif), *Glendale (Calif), *Water reclamation plant, *Hyperion Treatment Plant.

Continuing growth of Glendale has resulted in waste water flows which exceed the contractual capacity that Glendale possesses in the City of Los Angeles sewerage system. The cities commissioned a study, in 1968, through a joint powers agreement to investigate the feasibility of constructing a joint water reclamation plant in the Glendale area. This comprehensive and fully documented report presents conclusions that it is necessary, and technically and economically feasible, to build and operate the plant through a joint-powers agreement. The proposed plant, designed for a capacity of 20 mgd in its initial stage, is to be built in 1970. Enlargement of the plant to 35 mgd is proposed for 1987. The final stage, to be completed in 1995, will bring the capacity up to 50 mgd. The plant will be constructed on 15 acres of Glendale property that is currently a community eyesore. Waste water taken from trunk sewers will receive primary and secondary treatment. The reclaimed water will be sparkling clear and will be suitable for use in irrigation, industrial cooling, fire fighting, et cetera. Solid wastes will be removed and put back into the sewer, for processing at the Hyperion Wastewater Treatment Plant. The initial cost is estimated at $5.60 million with the corresponding cost per acre foot estimated between $29 and $32. This unit cost will decrease as the plant capacity is increased, so that by the year 2025 the unit costs of the reclaimed water should be about $19 per acre foot. Federal assistance under Public Law 660 appears promising. (Poertner)

ALTERNATIVES FOR THE TREATMENT AND DISPOSAL OF ANIMAL WASTES,
Cornell Univ., Ithaca, N.Y. Dept. of Civil and Agricultural Engineering.
Raymond C. Loehr.
Journal Water Pollution Control Federation, Vol 43, No 4, p 668-678, 2 fig, 2 tab, 10 ref.

Descriptors: *Farm wastes, *Disposal, *Treatment, *Systems analysis, Runoff, Pollutant, Nutrients, Aerobic treatment, Anaerobic digestion, Dentrification, Nitrification, Effluents, Legal aspects, Waste water treatment, Waste disposal.
Identifiers: Options, Land disposal, Oxidation ditch, Pollutional characteristics alternatives.

The various systems for treating wastes from enclosed confined animal production operations are discussed. There is no one process or waste management system that will be adequate for all animal production operations. Aeration systems such as oxidation ditches are gaining acceptance for waste handling and treatment. It is unlikely that current liquid waste treatment systems for treating concentrated animal waste water will produce effluents that can be discharged to surface water. Land disposal is an integral part of feasible animal waste treatment systems. (Christenbury-Iowa State)

LIVESTOCK WASTE,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
E. Paul Taiganides.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 57-66, 1 tab.

Descriptors: *Farm wastes, *Cattle, Poultry, *By-products, Confinement pens, Water pollution effects, Odor, Organic matter, Moisture content, Runoff, Ammonia, Biochemical oxygen demand, Biological treatment, Drying.
Identifiers: *Animal production, *Coprology, Feedlots, Production efficiency, Waste properties, Population equivalent, Waste transport, Treatment processes.

A short comprehensive review is given of the changes in animal production and waste handling techniques. The transition from pasture to confinement production has met the demand for agricultural food and fiber. There has been a corresponding increase in animal waste management problems. This has given rise to what the author refers to as coprology - manure science. Current coprological technology includes knowledge of manure characteristics, transport methods, waste treatment and utilization schemes, and disposal media. Disposal must be done in such a way and at such a rate that nature will be able to assimilate it without creating environmental problems. (See also W71-09752) (White-Iowa State)

AGRICULTURAL BENEFITS FROM URBAN POLLUTION CONTROL,
Office of the Secretary of the Army, Washington, D.C.
John R. Shaeffer.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 101-107.

Descriptors: *Water pollution control, *Sewage treatment, Sewage, Benefits, Agriculture, Environment, Pollutants, Water pollution effects, Pumping, Viruses, Diseases, Fertilizers, Irrigation, Michigan costs.
Identifiers: *Environmental vision, Waste management, Treatment cells.

An environmental 'vision' is needed which encompasses the fact that the environment is a single interacting closed system, and that pollutants are potential resources out of place. Utilizing these ideas, a pilot waste water management scheme for Muskegon County, Michigan is outlined. Sewage is first pumped to the surrounding countryside where treatment calls convert the waste to an odorless clear liquid by using all the forces of nature - air, aerobic bacteria, gravity, sunlight, and time. The liquid is then used as irrigation water and the soil removes the remaining nutrients, heavy metals, and viruses. An under drainage system picks up the pure water and brings it to a stream. For 42 million gallons of Muskegon County sewage a day, 10 thousand acres of land were needed. The costs for the new system are less than bringing the existing plants up to a secondary level of treatment. (See also W71-09752) (White-Iowa State)

THERMAL DISCHARGES: CHARACTERISTICS AND CHEMICAL TREATMENT OF NATURAL WATERS USED IN POWER PLANTS,
Oak Ridge National Lab., Tenn.
W. L. Marshall.
AGC Contract No. W-7405-eng-26. ORNL-4652, UC-48, UC-80, Reactor Chemistry Division, February, 1971, 12 p. 15 ref.

Descriptors: *Thermal pollution, *Powerplants, Cooling towers, Dissolved oxygen, Corrosion, Scaling, Acidity.
Identifiers: *Thermal discharges, *Chemical treatment, Natural water, Chemical composition.

The purpose of this report is to present information on the constituents of natural waters and the resultant composition of thermal discharges to the environment when these waters are used for cooling thermal powerplants. A weighted mean average of salts in all rivers has been given as 100 mg/liter. The equilibrium solubility of oxygen from an atmospheric mixture of gases at 25C and 1 atm is 8.3 mg per liter of pure water and that of nitrogen is 14.5 mg per liter. In the usual practice for the treatment of once-through water from open rivers or lakes, the gas chlorine is added as biocide about 3 times a day (shock treatment) for approximately a 30 minute period for each addition. Sodium chromate may be added to maintain from 25 to 50 ppm chromate in order to prevent corrosion of condenser surfaces and any other metal parts in the system. The compound ethylenediaminetetraacetic acid (EDTA) has been used to prevent or inhibit scale formation if the water used in cooling towers is sufficiently hard, but the relatively high cost of this substance prohibits its widespread use. Water used in closed cycle primary coolant loops of nuclear reactors should be polished to eliminate those impurities that would become radioactive. This article contains 15 references. RESUME OF SEWERAGE AND REFUSE DISPOSAL PRACTICES OF SANITATION DISTRICTS OF LOS ANGELES COUNTY,
Los Angeles County Sanitation Districts, Los Angeles, Calif.
John D. Parkhurst.
June 1970. 11 p, 6 fig.

Descriptors: *Administration, *Environmental sanitation, *Legislation, *Sewage districts, *Sewage disposal, Sewage treatment, Solid wastes, Outlets, Sewage effluents, Sewage disposal.

Identifiers: *Los Angeles County Sanitation Districts.

The rapid population growth in Southern California following the first World War resulted in overloading sewage treatment facilities, especially in Los Angeles County. In 1923, the state legislature passed the County Sanitation District Act which authorized the board of supervisors of any county to organize a sanitation district with boundaries determined by geographic and topographic drainage areas, without regard to political subdivision. The primary function of such a district is to construct, operate, and maintain facilities to collect, treat and dispose of sewage and industrial wastes. The construction of local sewers and laterals and their connection to the sanitation district's systems remained the responsibility of local authorities. In 1949 the act was amended to authorize districts to provide for the disposal of solid wastes. The major reason for the success of the sanitation districts has been the power to join with other districts to own, construct, maintain, and operate joint facilities. The resume summarizes the operations and organization of the Sanitation Districts of Los Angeles County and the key agreements which have facilitated their administration. Brief descriptions are given of the sewerage systems and outfalls as well as the sewage treatment and waste water reclamation facilities of the Districts. Explanations are given of the Joint Refuse Transfer Disposal System Agreement and the Districts' policies for construction and operation of refuse transfer and disposal facilities in Los Angeles County. INTRODUCTION TO OIL FIELD WATER TECHNOLOGY,
A. G. Ostroff.
Englewood Cliffs, NJ, Prentice-Hall, Inc, 1965, 412 p.

Descriptors: *Oil industry, *Injection wells, *Corrosion brine disposal, *Artificial recharge.
Identifiers: *Water pollution legislation, Water analysis, Water treatment microbiloty, Filtration, Chemical feeders, Boiler and cooling water treatment.

This book provides up-to-date information on oil field water treatment techniques. It covers the chemical, physical, and biological problems encountered with these waters and their causes and correction. Various treatments are presented for injection, disposal, produced, boiler, cooling and plant waters. It deals specifically with water treatment problems encountered in production and includes considerable material on subsurface water injection and treatment. Coverage of sampling and analysis techniques is provided as well as causes of scale, corrosion, and pollution and methods for minimizing these problems. It also details microbiological problems and factors which influence bactericide selection. The book is very well illustrated and referenced. Many of the procedures and concepts are of direct interest to workers in the field of groundwater supply. (Campbell-NWWA)

Identifiers: *Triiodide ions, Salmonella typhimurium, Streptococcus fecalis, Staphylococcus aureus, Pseudomonas aeruginosa.

The introduced water disinfectant is a water insoluble compound of basic anion-exchange resins with triiodide ions. This combination proved to possess remarkable antibacterial properties killing 300,000 Escherichia coli cells per ml in a 3.8 g column. The bacteriocidic effect extends to Salmonella typhimurium, Streptococcus faecalis, Staphylococcus aureus, and Pseudomonas aeruginosa. The results were demonstrated by the use of C-14 labeled bacteria. The insolubility and the high capacity of the compound promise its wide application in houses, hospitals, agriculture, and cooling water systems. The exact mechanism of the bacteriocidic effects is being investigated. (Wilde-Wisconsin)

NEW LIFE FOR 'MINI-LAKE ERIES',
Wisconsin Dept. of Natural Resources, Madison.
Thomas L. Wirth.
Wisconsin Conservation Bulletin, Vol 36, No 2, p 7-9, March-April 1971. 3 fig.

Descriptors: *Lakes, *Water quality control, *Project planning, *Economics.
Identifiers: *Upper Great Lakes Regional Commission, Snake Lake, Horseshoe Lake, Lake Marion.

A project being conducted jointly by the University of Wisconsin and the Upper Great Lakes Regional Commission is attempting to demonstrate methods useful for restoration and protection of inland lakes. The article describes three demonstration projects focusing on the physical, economic and original aspects of each project. (Holmes-Rutgers)

EFFECTS OF LIMNOLOGICAL FACTORS ON WATER TREATMENT,
Iowa Univ., Iowa City.
Donald B. McDonald, and Neil B. Fisher.
Available from the National Technical Information Service as PB-201 000, $3.00 in paper copy, $0.95 in microfiche. Completion Report ISWRRI-32, Iowa State Water Resources Research Institute, April 1971, 9 p, 2 tab, 4 ref. OWRR Project A-028-IA (4).

Descriptors: Limnology, *Water treatment, Turbidity, Lignins, Chlorine, Biochemical oxygen demand, Iowa.
Identifiers: Coralville Reservoir, Clear Creek, Threshold odor, Tannis.

Comparisons between previously determined Coralville Reservoir conditions and water plant operations indicate that various limnological conditions are frequently accompanied by specific treatment problems at the University of Iowa Water Treatment Plant. In general, it appears that three periods of high odor values occur annually, during summer and early fall, during late winter and early spring and during early winter. It appears that the operation of the Coralville Reservoir as a flood control structure has a significant effect on limnological conditions within the impoundment and the downstream river. Preliminary comparisons indicate that extended periods of static water level or rapid drawdown may result in increased taste and odor problem at the Water Plant. Laboratory studies were undertaken using a synthesized water and running jar tests to determine what treatment process modifications would be beneficial during critical periods. From experimental runs using five different types of activated carbon it was found that a reduction in the parameters of ammonia, tannin, and taste and odor was accomplished. No other type of carbon was more satisfactory in removing these parameters than the activated carbon normally used in water treatment. Normally used activated carbon gave best removal at 70 ppm. When the water was chlorinated a taste and odor developed that made the water unsatisfactory.

A REVIEW OF THE LITERATURE OF 1968 ON WASTEWATER AND WATER POLLUTION CONTROL - INDUSTRIAL WASTE, RADIOACTIVE,
C. P. Straub.
Journal Water Pollution Control Federation, Vol 41, 1223-1251, June 1969.

Descriptors: *Industrial Wastes, *Water, *Control, *Water Quality control, *Water pollution, Water pollution control, Water treatment, Chemical precipitation, Ion exchange, Solvent extractions, Adsorption, Absorption, Electrodialysis, Waste disposal, Oceans, Rivers, Sedimentation, Monitoring, Analytical technique.
Identifiers: Radioactive wastes, Decontamination, Waste management.

The following topics relating to radioactive industrial waste disposal were reviewed (with 167 references): U recovery, waste water treatment by precipitation of radionuclides, solvent extraction, ion exchange, adsorption, uptake on natural materials, electrodialysis, and fixation; ground disposal; disposal in the hydrosphere (oceans, rivers); uptake on sediments; monitoring; and analysis. In the United States increased emphasis is placed on concentrating, solidifying, and containing wastes. Only a nonhazardous, economically irreducible minimum of radioactive material is to be discharged to the environment. Waste management practice at nuclear power plants operates within the limits authorized for release of radioactive wastes to the environment at costs estimated to range between 2 and 10% of their total operating

costs. The average activity in liquid wastes varies from 0.01 to 11.1 Ci, exclusive of 3H. Tritium levels range from 5 to 1300 Ci annually. Use of high-pressure washing and rewashing for leaching U from mined-out areas is referred to. Removal of specific radionuclides by various treatments of waste water is outlined. The presence of detergents affects the treatment of wastes by precipitation; the effect is increased at increased detergent concentrations and generally increases with decreased pH. How 90 Sr is extracted from various radioactive waste solutions at the Hanford B plant is explained. A study to determine if low-cost nuclear energy, heat, radiation, or electricity could be used to reduce the cost of waste water treatment is reviewed. (Houser-NSIC)

THE ANATOMY OF AN IN-TRANSIT SPILL,
Monsanto Co., St. Louis, Mo. Industrial Hygiene and Pollution Control.
Jack T. Garrett.
Journal Water Pollution Control Federation, Vol 43, No 5, May 1971, p 773-778.

Descriptors: *Transportation, *Accidents, *Water pollution control, Neutralization, Biodegradation, Solubility, Toxicity, Hydrogen ion concentration, Sampling, Public health, *Hazards, Water pollution control.

In-transit spills of manufactured products which are being moved overland by truck or train are many times potential contributors to water pollution in the area of the spill. In the past, little notice has been made of this fact, with the primary concern being with the danger of fire, explosion, or direct contact with corrosive materials by individuals in the immediate area. The characteristics needed to evaluate the fire, explosion, or contact danger are generally readily available, whereas the pollutional potential characteristics are not. The characteristics most necessary to evaluate the pollutional potential of a spill are: (1) solubility in water; (2) toxicity to fish and other aquatic life; (3) specific gravity; (4) the effect of neutralizing solvents on the solubility in water, toxicity, and pH of the receiving stream; (5) treatment chemicals, if any, that can reduce the pollution effects; (6) biodegradability; and (7) any other information which may be pertinent. The key to an operation of this type is speed, necessitating development of an information system which will provide ready access to plant officials, pollution control agencies, and law enforcement officials. A small beginning has been made by the National Agricultural Chemists Association, The Manufacturing Chemists Association, and the American Petroleum Institute in working on the problem of information availability for accident use by transportation companies, and local, state, and federal agencies. (Lowry-Texas)
W71-09540

THE OCCURRENCE OF FUNGI IN ACID-MINE DRAINAGE,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
William B. Cooke.
Proceedings, Industrial Waste Conference, 21, Vol L, No 2, Mar 1966, p 258-274, 5 tab, 18 ref.

Descriptors: *Fungi, *Mine drainage, Iron, Hydrogen ion concentration, Laboratory tests, Microbiology, Cultures, Bacteria, Yeasts, Molds, Carbon, Nutrients, Sediment, Habitat, Acclimatization, Tributaries, Summer, Fall, Winter, Water analysis, West Virginia, Ohio, Water pollution control.
Identifiers: Ohio River System.

Problems arising from pollution resulting from acid mine drainage have been recognized in the United States since 1902. The role of fungi in this field has, however, been largely ignored until recently. A new phase of study was begun in 1964 when tributaries of the Ohio River were studied at three points in Ohio and West Virginia which varied in the amount of pollution found. Samples were taken in spring, fall, and winter from the stream bed, the stream, the creek bank at the water level, and the creek bank at a point where water reached the soil only during severe flood conditions. Colonies which resulted in the sample cultures yielded 202 species and species groups. No study of the role of these species in mine-drainage could be made at that time. Studies which were made showed that fungi were exposed to high degrees of acidity and large amounts of iron compounds. Other studies have shown that fungi can readily adapt to a wide variety of habitat factors. Some species are thought possibly helpful in the removal of organic pollutants from water and may at the same time be involved in the production of organically stabilized colloidal iron. True fungi do not seem directly involved in transformations leading to the type of pollution referred to as 'acid-mine drainage' or to be involved in lowering the acidity of their environment. POLLUTION CONTROL FOR MINING AND PROCESSING OF INDIANA COAL,
Indiana State Board of Health, Indianapolis.
Richard A. Woodley, and Samuel L. Moore.
Proceedings, Industrial Waste Conference, 20, Vol XLIX, No 4, p 265-274, 4 fig, 8 ref.

Descriptors: *Coal mine wastes, *Mine drainage, Strip mine, Underground mining, Land reclamation, Revegetation, Water reuse, Hydrogen ion concentration, Alkalinity, Diversion structures, Excavation, Overburden, Slurries, Sediments, Waste water treatment, Industrial wastes, Indiana.
Identifiers: Coal fines, Clarification ponds, Processing plant.

The Indiana Stream Pollution Control Law of 1943, created the Indiana Stream Pollution Control Board which has control over the pollution of any waters in the state. Indiana mine owners are required to dispose of refuse from processing coal in a manner which will create minimal acid mine drainage and deposits of coal fines. A stream is considered polluted if it has a pH of less than 6.0, alkalinity of less than 50 mg/l and coal fine deposits. Two of the major problems are surface mine drainage control and processing plant pollution control. Underground mine drainage control is also a problem, but is not very serious because of the small number of underground mines in Indiana. Devices such as diversion ditches for surface streams, pumps for conveying precipitation and infiltration from the excavation and deposit of acid producing material in excavations which will be filled with cast overburden are used to prevent pollution of other waters with acid or coal. Flooding, grading to approximate original contour, and revegetation procedures are also used. Care must be taken, too, that coal haulage roads are not made of acid-producing materials. Should this occur, soil or limestone is used to cover the road. Pollution from coal processing is handled by clarification ponds to settle out coal fines in the wash water. Processing refuse is taken to excavations of surface mines and covered. Refuse at underground mines is placed where it can be covered most easily. A closed system in which drainage from the clarification pond and refuse disposal site is combined, treated, and reused for wash water at the processing plant. (Lowry-Texas)

THE APPLICATION OF BACTERIAL PROCESS KINETICS IN STREAM SIMULATION AND STREAM ANALYSIS,
Georgia Inst. of Tech., Atlanta.
W. E. Gates, J. T. Marlar, and J. D. Westfield.
Water Research, Vol 3, 1969, p 663-686, 14 fig, 1 tab, 14 ref. OWRR Research Report No A-003-GA (6).

Descriptors: *Hydrogen sulfide, *Foam fractionation, Catalysts, Surfactants, Separation techniques, Oxidation, Filtration, Precipitation (Chemical), Economic feasibility, Technical feasibility, Cost analysis, Water purification, Waste water treatment, Water pollution control.
Identifiers: *Residual.

Three surfactant and surfactant-catalyst systems were studied to determine their feasibility for removal of H2S from sour water, and the recovery of elemental sulfur. The surfactants chosen for study were those known to be capable of forming intermediates in the oxidation in the presence of oxygen, of H2S to sulfur. The surfactants generated a stable foam which was removed and collected. The precipitated sulfur was removed by filtering the foamate. The surfactant was then recycled to the process and re-used. These systems were shown to be capable of reducing the hydrogen sulfide to less than .1 ppm while leaving 40 to 80 ppm of residual surfactant in the effluent. The residual surfactant, since the surfactant used were all biodegradable, presented no hazard to receiving waters, but cost of replacement of the amount lost was excessive. Maximum sulfur recovery was 16% by weight, under the conditions of the investigation. Under the best possible operating conditions (16wt % sulfur recovery and 40 ppm surfactant in effluent), the operating expense was determined to be 3.5 mil/bbl of (200 ppm H2S) sour water treated. LABORATORY AND MATHEMATICAL SIMULATION OF OXYGEN BALANCES EFFECTED IN STREAMS,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
William E. Gates.
Available from the National Technical Information Service as PB-200 821, $3.00 in paper copy, $0.95 in microfiche. Environmental Resources Center, Georgia Institute of Technology, ERC-0171, April 1971. 52 p, 23 fig, 8 ref. OWRR Project A-003-GA (8).

Descriptors: *Stream analysis, *Waste assimilative capacity, *Oxygen sag, *Wager quality control, *Waste water treatment, Dissolved oxygen, Chemical oxygen demand, Bio-Kinetics, Aquatic bacteria, Water pollution effects, Waste management.
Identifiers: *Streeter-Phelps Equation, *Monod Equations.

The project objective was to develop methodology for evaluating and predicting the impact which various parameters and components of waste water have on the dynamic oxygen balance in a receiving water. Dynamic oxygen balances obtained under a variety of oxygenation and deoxygenation conditions were studied in the laboratory using batch reactors and in the field using natural streams. The Streeter-Phelps expression for the mathematical description of oxygen sag curves was found inaccurate due to inclusion of the first order expression for describing substrate utilization by bacteria. Monod Equations were found valid for defining bacterial substrate utilization and protozoa bacterial utilization. Substrate utilization as determined by the COD test was found to be dependent on the time frame for sampling. It was found that the shorter the time frame, the greater the variances and apparent inconsistencies in the data. Techniques were developed for determining Monod Equation constants using batch reactor data and data obtained under continuous dilution in a natural stream. In general, the studies indicate that laboratory evaluation of the impact of alternative methods of water resources management on

the oxygen resources of the receiving stream is valid. (See also W71-09553) (Conway-Georgia Tech)

RETENTION BASIN CONTROL OF COMBINED SEWER OVERFLOWS.
Springfield Sanitary District, Springfield, Illinois.

Copy available from GPO Sup Doc as , $1.00; microfiche from NTIS as PB-200 828, $0.95. Environmental Protection Agency, Water Quality Office, Water Pollution Control Research Series 11023---08/70, August 1970. 97 p, 37 fig, 4 tab, 8 ref. EPA-WQO Grant 3-111-1.

Descriptors: *Water pollution control, *Settling basins, *Surface runoff, *Storm runoff, *Waste water disposal, Drainage water, Stream improvement, Fishkill.
Identifiers: *Combined sewer overflows, *Retention basins.

The Springfield Sanitary District constructed a 10 acre basin to collect and detain combined sewer overflows that bypass the Cook Street Pumping Station during periods of high volume flow. Surface runoff accompanying rainstorms cause high volume flows which are diverted into the Cook Street Channel. Such flows introduce highly toxic pollution loads into Sugar Creek and the South Fork of the Sangamon River. The retention basin was built to intercept these flows so that they could be stored temporarily and released at low flow rates into Sugar Creek to avoid shock pollution of the stream. Historically, the high concentrations of pollutants discharged into Sugar Creek have caused serious fishkill. The retention basin was designed to retain water to a depth of four feet before it discharges captured runoff through a spillway provided with a notched weir. Average annual reduction of BOD was 27 percent and coliform reduction averaged 72 percent. However during the period from June through October 1969, production of algae in the basin caused the effluent BOD to consistently exceed that of the influent. In addition to the oxygen demand on the stream, production of algae may be objectionable at some installations for aesthetic reasons. Sludge accumulation was significant in the basin and must be taken into account in design of similar facilities. Suggestions for future designs of retention basins are included. (Poertner)

PROCEEDINGS, MISSISSIPPI WATER RESOURCES CONFERENCE, 1971.
Mississippi State Univ., State College. Water Resources Research Inst.

Available from the National Technical Information Service as PB-200 829, $3.00 in paper copy, $0.95 in microfiche. Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, 1971. 80 p. OWRR Project A-999-MISS (7).

Descriptors: *Water resources development, *Mississippi, *Conferences, *Water resources research act, Reservoirs, Water quality, Monitoring, Navigation, Waste water treatment, Water management (Applied).
Identifiers: *Mississippi Water Resources Conference (1971).

The sixth Mississippi Water Resources Conference was held in Vicksburg on 13-14 April for the purpose of exchanging information pertaining to water resources. Topics discussed include nutrients and algal removal from oxidation ponds effluents, chlorinated hydrocarbon insecticide contamination of streambed sediments in the Mississippi River delta, effects of turbidity on forest recreation potentials, economic determinants for sediment management on a north Mississippi watershed, water management implications in the south's third forest, restoration and development of the port of gulfport, establishment of an automatic water quality surveillance program, and water resource problems and opportunities associated with multiple-purpose impoundments. (See also W71-09629 thru W71-09634) (Knapp-USGS)
W71-09628

NUTRIENTS AND ALGAL REMOVAL FROM OXIDATION PONDS EFFLUENTS,
Mississippi State Univ., State College. Dept. of Sanitary Engineering.
Adnan Shindala.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 1-7, 1971. 7 p, 1 fig, 1 tab, 3 ref.

Descriptors: *Algae, *Waste water treatment, *Tertiary treatment, *Coagulation, *Oxidation lagoons, Aerobic treatment, Oxidation, Organic matter.
Identifiers: Nutrient removal.

Chemical coagulation is an effective post treatment process for algal removal and for improving the quality of effluents from stabilization ponds. Of the coagulants tested, alum was the best. The optimum dosage for best removal of the parameters studied was in the range of 75 to 100 mg/liter. Using this dosage, the supernatant from the chemical coagulation process was found to contain 2.5 mg/liter BOD, 22.9 mg/liter COD, 1.5 mg/liter total phosphates, 3.5 mg/liter total phosphates, 3.5 mg/liter total nitrogen, 500 to 1000 algal cells/ml and approximately 5,000 coliforms/100 ml. The algae in the pond effluents contribute heavily to the BOD, COD, and nitrogen in the effluent, while the contribution to the phosphates concentration was less important. (See also W71-09628) (Knapp-USGS)
W71-09629

CHLORINATED HYDROCARBON INSECTICIDE CONTAMINATION OF STREAMBED SEDIMENTS IN THE MISSISSIPPI RIVER DELTA,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
L. L. McDowell, E. H. Grissinger, G. C. Bolton, D. A. Parsons, and W. F. Barthel.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 9-21, 1971. 13 p, 5 fig, 2 tab, 3 ref.

Descriptors: *Mississippi, *Path of pollutants, *Chlorinated hydrocarbon pesticides, *Mississippi River, *Bottom sediments, Water pollution sources, Farm wastes, Industrial wastes.
Identifiers: *Mississippi Delta.

The large amounts of chlorinated hydrocarbon insecticides previously applied to crops in the Mississippi River Delta have not created widespread chronic contamination of the streambed sediment in the Mississippi River (detectable at 0.01 ppm). On the tributaries, with one exception, DDT analogs and metabolites were the only residue originating from agricultural or urban sources. Significant contamination resulted from manufacturing operations in the Wolf River-Cypress Creek complex at Memphis, Tenn., and from a group of pesticide formulating plants in Mississippi. Concentrations of individual pesticides ranged from non-detectable to 24,000 ppm. (See also W71-09628) (Knapp-USGS)
W71-09630

EFFECTS OF TURBIDITY ON FOREST RECREATION POTENTIALS,
Forest Service (USDA), Jackson, Miss.
Robert J. Lentz.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 23-28, 1971. 6 p, 2 tab, 9 ref.

Descriptors: *Water quality, *Recreation, *Turbidity, *Planning, Swimming, Fishing, Boating, Water pollution sources, Water pollution effects, Erosion, Erosion control, Forests.
Identifiers: Forest recreation.

Clear water is essential for a quality recreation experience and is highly desirable from the standpoint of visual appeal, recreation enjoyment, and safety. Recreational development plans must consider environmental influences and be flexible to compensate for unforseen contingencies. Turbidity has a detrimental physiological and psychological effect on recreation users, and users affect water quality. Proper planning is essential to insure the best type of environment for a quality recreation experience. (See also W71-09628) (Knapp-USGS)
W71-09631

ECONOMIC DETERMINANTS FOR SEDIMENT MANAGEMENT ON A NORTH MISSISSIPPI WATERSHED,
Economic Research Service, Oxford, Miss. Natural Resource Economics Div.
Harold R. Cosper.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 29-40, 1971. 12 p, 1 fig, 4 tab.

Descriptors: *Sediment control, *Cost-benefit analysis, *Economics, *Mississippi, Forest management, Channel improvement, Check structures, Dam construction, Silting, Soil erosion, Erosion control.
Identifiers: Pigeon Roost Creek (Miss).

Studies pertaining to economic and physical relationships within a watershed acre conducted on a 117-square-mile section of the Pigeon Roost Creek Watershed in North Mississippi. The principal emphasis for management and control of sediment in the Pigeon Roost Creek Watershed of North Mississippi was on retaining the sediment on the watershed. This was done by artificial barriers to trap and retain the sediment, and land use change

to reduce and prevent further soil losses off the watershed. The necessary economic determinants required to assess economic efficiency include not only the direct capital investments but also any economic adjustments in the farming enterprise. Average total direct capital cost was $8.95 per watershed acre for the 74,900 acres. Sediment-retarding structures accounted for $4.61 per acre, and the reforestation program for $4.34. The increase in forested acres was not an economic cost because this land had previously been idle. Also, there were no economic adjustments made on cultivated lands to specifically accommodate sediment management. (See also W71-09628) (Knapp-USGS)
W71-09632

WATER RESOURCES PROBLEMS AND OPPORTUNITIES ASSOCIATED WITH MULTIPLE-PURPOSE IMPOUNDMENTS,
John P. Burt.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 75-80, 1971. 6 p.

Descriptors: *Water resources development, *Water quality, *Planning, *Water quality control, *Mississippi, Reviews, Water storage, Multiple-purpose reservoirs.

Some of the problems associated with developing impoundments for water supply and recreational water contact sports in addition to other water use purposes are reviewed. The criteria for these two purposes are more stringent than for other water use purposes and were used to illustrate the water resources problems. Usually, no water quality criteria problems are associated with purposes of flood storage, storage for flow augmentation or irrigation unless unusual circumstances exist in the drainage area. ESTABLISHMENT OF AN AUTOMATIC WATER QUALITY SURVEILLANCE PROGRAM,
Corps of Engineers, Mobile, Ala. Environmental Quality Section.
Nathaniel D. McClure, IV.
Conference held April 13-14, 1971, Vicksburg, Water Resources Research Institute, Mississippi State University, p 67-74, 1971. 8 p, 13 ref.

Descriptors: *Water quality, *Monitoring, *Mississippi, *Water resources development, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Electrical conductance, Turbidity, Reservoirs, Canals.
Identifiers: *Water quality monitoring.

In an attempt to obtain information about the effect existing water resource developments in Mississippi and Alabama have on water quality, an Automatic Water Quality Surveillance Program was developed. The basic component of this program is the continuous water quality monitor. Five parameters are monitored: temperature, dissolved oxygen, pH, specific conductivity and turbidity. A paper tape punch was chosen for data recording because of its capability of directly interfacing with automatic data processing techniques. A computer program was developed to reduce the data to a more interpretable form. The weekly checkout of the remote station involves cleaning of the sample chamber, examining all sensors, adding of electrolyte to the D.O. and pH probes as necessary and a calibration check of three parameters. STOCHASTIC POPULATION DYNAMICS FOR REGIONAL WATER SUPPLY AND WASTE MANAGEMENT DECISION-MAKING,
Massachusetts Univ., Amherst.
Peter Meier.
Water Resources Research, Technical Report No EVE 25-70-5, August 1970. 207 p, 37 fig, 22 tab, 105 ref, 5 append. OWRR Project B-011-MASS (4).

Descriptors: *Regional analysis, *Water management, *Input-output analysis, *Population, Dynamics stochastic processes, Optimization.

A methodology for local area population projection and water and sewer service area prediction was developed. The projection model consisted of a stochastic simulation of interregional population growth and a finite-difference solution to a non-

linear differential equation describing spatial variations in urban population densities. The projection model output was designed as input to optimization algorithms for region-water supply and waste treatment facilities. The components of demographic change were modeled as autoregressive stochastic processes, and a response surface algorithm was developed to decompose net migration rates into in- and outmigration rates. Service area prediction was based on a computerized evaluation of the distance-density relations at the existing service area periphery. Comparison of results to preliminary 1970 census figures indicated a superior prediction performance over traditional methods of population projection as practiced by consulting engineers and planners. A DOSING SIPHON FOR DISCHARGING CLEANING WATER INTO FLUSHING GUTTERS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
H. L. Person, and J. R. Miner.
Unpublished paper presented at the 1971 Mid-Central Region Meeting American Society of Agricultural Engineers. Paper No MC-71-105, 22 p, 10 fig, 3 ref.

Descriptors: *Farm wastes, Design data, Equipment, Confinement pens, Test procedures, Theoretical analysis, Water pollution control.
Identifiers: *Flushing gutter, *Dosing siphon, Waste removal, Snifter.

An automatic dosing siphon has been designed, built, and used for discharging water into flushing gutters. An explanation of how the device operates as well as test data and design information are presented. The automatic dosing siphon is easy to design and build. The parts are commercially available. If proper precautions are taken to ensure that all joints are airtight, the automatic dosing siphon is a dependable device for discharging cleaning water into flushing gutters. (Christenburg-Iowa State)

ECONOMICS OF POLLUTION CONTROL,
Iowa State Univ., Ames. Dept. of Economics.
John F. Timmons.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 77-85.

Descriptors: *Environment, *Water pollution control, Economics, Natural resources, Standards, Programs, Costs, Benefits, Watersheds, Agriculture, Water pollution effects.
Identifiers: *Environmental quality, Goals, Quality standard, Suspended sediment, Production costs.

The paper suggests some ideas and methods that appear useful in understanding and in resolving some of the difficult but important issues emanating from three environmental quality questions. First, what are the standards of environmental quality that can serve as policy and program goals and at the same time engender wide spread and continuing public understanding and support. Next, what are the costs, both monetized and non-monetized, of both achieving and failure to achieve the stated standards of environmental quality. Thirdly, who pays the costs both with and without achievement of the standards of environmental quality and who gets the benefits. Since environmental quality is a national issue, the author has endeavored to identify and elaborate upon these three major considerations in our quest for improvements in the quality of the natural environment. CURRENT CONSERVANCY LEGISLATION,
Iowa House of Representatives, Des Moines.
Dale M. Cochran.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 87-93.

Descriptors: *Soil conservation, *Legislation, Wind erosion, Drainage, Soil erosion, Water pollution effects, Sediment, Rivers, Fertilizers, Pesticides, Agriculture, Iowa.
Identifiers: *Conservancy Districts, Des Moines River, District soil commissioners, Non-farm sources, US Department of Agriculture.

The scope and content of Iowa's Conservancy District bill is explained in this paper. The bill resulted after a review and study of drainage laws indicated that flood control, water pollution, recreation, soil erosion, and others were closely related. Conservation efforts have become rather static for a number of reasons, among them apathy, large operators, and shifts to continuous row crops. The Conservancy bill, as proposed, would regulate farm and non-farm sources of erosion both by wind and water. The local soil conservation district commissioners would be in charge of soil conservation compliance. Cost sharing would be available for those required to comply. Failure to comply could result in a court order requiring immediate compliance and loss of any cost sharing funds that might have been available. (See also W71-09752) (White-Iowa State)

POLLUTION CONTROL DECISIONS - WHO SHOULD MAKE THEM,
Resources for the Future, Inc., Washington, D.C.
Edwin T. Haefele.
In: 33rd Annual Forum, National Farm Institute, February 1971, Des Moines, Iowa, p 95-99.

Descriptors: *Water pollution control, *Pollution abatement, Governments, Legislation, Environment, Taxes, Water pollution effects, *Decision making.
Identifiers: Individual rights, Executive responsibility.

Four lessons have been learned in the developing history of our country to the problems of pollution control. The first lesson is the necessity for legislative determination of policy. Most environmental issues are not problems that can be solved but conflicts that must be resolved. Individual rights is the second lesson. All of us are exercising our individual rights to the detriment of all of us. Rightfull use by each individual is the central core of the problem of over use of common property resources. The need for executive responsibility is the third lesson. The fourth lesson involves connecting the notion of individual right with that of personal interest through the use of taxation and prices as regulatory devices. BASIC DATA ON HEAT DISSIPATION DOWNSTREAM FROM LARGE HEAT SOURCES,
Geological Survey, Washington, D.C.
A. P. Jackman, and E. L. Meyer.
In: Fifth Annual Health Physics Society Midyear Tropical Symposium, Health Physics Aspects of Nuclear Facility Siting, Vol. 3, p. 748-763, November 3-6, 1970. Idaho Falls, Idaho, 8 fig.

Descriptors: *Thermal pollution, *Thermal powerplants, Temperature, Meteorological data, Convection, Sites, Stream flow, Mass transfer, Water pollution control.
Identifiers: *Thermal discharge, *Heat dissipation, Heat flux.

The heat dissipation has been measured downstream from 7 large heat sources on rivers in the United States by the United States Geological Survey in cooperation with the United States Atomic Energy Commission. The purpose of the measurements was to provide basic reference data for the planning and design of thermal electric power stations and for verification of theoretical models of heat dissipation in streams. The data were collected during intensive 24-hour surveys repeated up to three times during one year at each site. Stream temperature and discharge data in great detail were obtained at several cross sections in reaches extending up to 31 km downstream from the heat source; selected meteorologic data were also collected within each reach. Even in the longest reaches more than 60 percent of the added heat was observed in the river at the downstream end of the reach. These observations are consistent with a theoretical evaluation of the heat dissipation based on the Stefan-Boltzmann equation, Harbeck's mass transfer approximation of evaporative heat flux, and the Bowen ratio. Heat losses observed varied greatly and include an episode when practically no loss of heat was observed for six hours in a 10-mile reach despite water temperatures 10C higher than air temperatures, probably due to a dense fog confined to the stream channel. CHLORINE MAKERS CLUTCH AT LAST DROPS OF MERCURY.

Chemical Week, Vol. 108, No. 8, p. 75-77, February 24, 1971.

Descriptors: *Heavy metals, Water pollution control, Pollution abatement.
Identifiers: *Mercury, *Chlorine industry, *Mercury recover.

The problems of stopping mercury losses are complex. In general, mercury leaves the mercury cells of a chlorine plant primarily in the hydrogen, caustic and chlorine streams. It is also found in the cell outlet brine, filter, various wastewater and condensate streams. At least one plant is using ferrous chloride, instead of inorganic sulfides, for precipitation, which results in the range of 100-300 ppb of mercury in the effluent. Other methods of reducing mercury contents in the effluent are mentioned such as Bayer's method which, with the use of carbon, reduces mercury concentration to 0.01 mg/m3, or Ventron's method of precipitating metallic mcerucy. N.J. Zinc has demonstrated the application of zinc dust for dramatic reduction of mercury in wastewaters. (Oleszkiewicz-Vanderbilt)

EVALUATING OIL SPILL CLEANUP AGENTS. DEVELOPMENT OF TESTING PROCEDURES AND CRITERIA,
California State Water Resources Control Board, Sacremento.
Charles R. Hazel, Fred Kopperdahl, Norman Morgan, and Walter Thomsen.
California Water Resources Control Board Publication No. 43, July 6, 1970, 150 p, 67 fig, 17 tab, 100 ref.

Descriptors: *Oil wastes, *Cleaning, *Dispersion, *Chemicals, *Surfactants, *Toxicity, *Bioassay, Fish, Shellfish, Algae, Degradation.
Identifiers: *Dispersants, *Collecting agents, *Sinking agents, Effectiveness, Testing procedures, Criteria, Classifications.

Criteria for licensing and regulating the use of oil spill cleanup agents was studied and developed. Criteria included toxicity, performance effectiveness and physical-chemical descriptions of the OSCA. Bioassays were performed to establish 96-hour TLM values for dispersants, oil and combinations of oil and dispersants. Biodegradation of dispersants was tested by BOD, foam calibration and toxicity decay bioassay. Miscibility with seawater, percent of oil emulsified, oil sinking and dispersion after several hours were the criteria for performance effectiveness tests. Feasibility of 'fingerprinting' dispersants were tested quantitatively. Licensing criteria and test procedures for product flash point, P.H, trace substances and occupational health hazards were determined. (Ensign-PAI)

1970 REPORT OF THE INTERSTATE SANITATION COMMISSION.
Interstate Sanitation Commission, New York.

Report of the Interstate Sanitation Commission on the Water Pollution Control Activities and the Interstate Air Pollution Program, 1970, 69 p.

Descriptors: *Water pollution control, *Waste water disposal, *Water analysis, *Biochemical oxygen demand, *Treatment facilities, Nutrients, Coliforms, Air pollution, New York, New Jersey, Connecticut.

A record of the water and air pollution activities of the Interstate Sanitation Commission and the work and planning on water pollution control projects within the Interstate Sanitation District are reported for 1970. Planning and construction provided for a minimum of 80% BOD removal to waste water effluents discharged into District waters. Ability to conduct additional analyses which enabled the commission to act as a regional laboratory for state and federal agencies was expanded. A training program for treatment plant operators was continued. Dissolved oxygen and coliform density showed an increase since the last report. The Commissions responsibilities and programs for air pollution are also reported. (Ensign-PAI)

ALTERNATIVE OXYGENATION POSSIBLITIES FOR LARGE POLLUTED RIVERS,
Putgero-The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr., and Shaw L. Yu.
Water Resources Research, Vol 7, No 3, p 566-579, June 1971. 14 p, 12 fig, 1 tab, 23 ref. EPA - Water Quality Office Project 16080 DUP.

Descriptors: *Water pollution treatment, *Aeration, *Oxygenation, *Delaware River, *Estuaries, Reaeration, Application equipment, Cost-benefit analysis, Sewage treatment, Stream improvement.
Identifiers: Delaware Estuary.

The idea of induced aeration of polluted rivers is gaining acceptance, prototype equipment having been installed on the Miami River in Ohio and on the Ruhr River in Germany. Aeration is feasible and in use on some small rivers. This paper describes tests of aeration equipment on a major river, the Delaware Estuary, and discusses transfer efficiency, suitable aerator system design, and cost comparisons. Navigational considerations and deeper, more turbulent water cause design requirements for large rivers to differ considerably from the requirements for small rivers. Reinforced aerators at the surface appear favorable for uncrowded river areas, but air diffusers on the bottom appear more practicable and comparably economical for port areas. Diffusers can be placed only on channel margins and anchorage areas, but dispersion studies indicate that the oxygenated water will still reach the center of the river within a reasonable distance. The cost of adding one unit of dissolved oxygen by aeration devices appears to be just about one-fourth that of adding it by waste treatment only. There are possibilities of lowering costs further by using oxygen diffusers. (Knapp-USGS)

PANGLOSS ON POLLUTION,
London School of Economics and Political Sciences (England).
E. J. Mishan.
Swedish Journal of Economics, Vol 73, No 1, March 1971, p 113-120.

Descriptors: *Pollution, Resource allocation, Risk, Welfare economics, Effluents, Water pollution control.
Identifiers: *Transaction costs, Equity, Spillover problem, Subsidy, Frictional cost, External diseconomy.

The view is considered that pollution above a theoretical optimum is justifiable economically as long as the transaction costs of correcting the suboptimal position exceed the optimality gains. Because of welfare effects and the magnitude of transaction costs, the overall optimal outputs of polluting activities under pollution permitting laws can be much greater than under optimal outputs under pollution prohibiting laws. For environmental pollution, the case for a change to anti-pollution laws rests mainly on equity and allocative merit with particular attention paid to the external diseconomies of increasing risk from adverse spillovers for future generations. This paper is of interest to water research concerned with pollution control. (Siegenthaler-Rutgers)

MODELS FOR INVESTIGATION OF INDUSTRIAL RESPONSE TO RESIDUALS MANAGEMENT ACTIONS,
Resources for the Future, Inc., Washington, D.C.
Clifford S. Russell.
The Swedish Journal of Economics, Vol 73, No 1, March 1971, p 134-156.

Descriptors: *Residuals management, Decision-making, Sewage treatment linear programming, Prices, Sensitivity analysis, Water pollution control.
Identifiers: *Cost of discharge, Objective function, Algorithm, End-of-pipe treatment.

It is argued that, for purposes of residuals management decisions, it is necessary to go beyond models that stress end-of-pipe treatment and a single receiving medium. Doubts are presented concerning the cost-of-discharge-reduction approach because it ignores the laws of conservation of energy and mass. The model used to investigate industrial response to residuals management policies reflects both the interconnections between residual forms and discharge media implied by the conservation of mass and energy and the opportunities available for the reduction of residuals generation in production. A description of the firm's decision-making process concerning residuals discharges is given and then modified to a form solvable by linear programming algorithms. An example is presented of the application of the linear residuals response model to the petroleum industry. The use of models of industrial response to residual management action for regional residuals management is considered. (Siegenthaler-Rutgers)

A METHOD OF ESTIMATING SOCIAL BENEFITS FROM POLLUTION CONTROL,
Handelshogskolan i Stockholm (Sewden).
Karl-Goran Maler.
The Swedish Journal of Economics, Vol 73, No 1, March 1971, p 121-133.

Descriptors: *Pollution control, Recreation, Demand function marginal cost, Marginal utility.
Identifiers: *Willingness to pay, Social benefits, Pareto optimality, Public good, Consumer surplus, Opportunity cost.

An approach to the estimation of social benefits from water pollution control is presented. A theoretical framework is developed which enables derivation of the willingness to pay for public goods on the basis of information on demand functions for private goods. The marginal willingness to pay or the demand price for the public good can be estimated by estimating the expenditure function as a function of public goods supplied. An example is given illustrating the technique of deriving the expenditure function. The theorems on uniqueness of solutions to differential equations show that the expenditure function ultimately derived is the correct one. (Siegenthaler-Rutgers)

BACKGROUND FOR THE ECONOMIC ANALYSIS OF ENVIRONMENTAL POLLUTION,
Resources for the Future, Washington, D.C.
Allen V. Kneese.
Swedish Journal of Economics, Vol 73, No 1, Mar 1971, p 1-24.

Descriptors: *Economic analysis, *Environmental quality, *Air pollution, *Water pollution, *Technology, Regional analysis, Wastes, Taxes, Investment, Population, Reservoirs, Sewage, Rivers, Transportation.

Identifiers: *Residuals, Production, Consumption, External diseconomies, Materials balance, Recycling.

The scientific and technological aspects of environmental problems are discussed in order to complement and complete the economic approach to these difficulties. Global and regional effects of environmental pollution are presented individually, then tied together in a 'materials balance' approach. In the discussion of the global effects of pollution, meteorological, hydrological and atmospheric difficulties are analyzed, including changes in carbon dioxide, waste energy rejection into the atmosphere, and toxic agents in coastal waters and oceans. A separate section on waterborne residuals deals with degradable residuals and persistent pollutants while the discussion on airborne residuals encompasses types and sources of such residuals, atmospheric assimilative capacity, and property damages. Technological external diseconomies are accepted as a fact, with residuals generation as an inherent part of production and consumption. Various alternatives are presented for both air and water pollution, incorporating a discussion of economic analysis to choose the optimal method for coping with such environmental difficulties. (Murphy-Rutgers)
W71-09889

ESSAY ON ECONOMIC GROWTH AND ENVIRONMENTAL QUALITY,
California Univ., Riverside.
Ralph C. d'Arge.
Swedish Journal of Economics, Vol 73, No 1, Mar 1971, p 25-41.

Descriptors: *Pollution, Environmental quality, *Wastes, Effluents, Model studies, Water quality, Water resource development, Investment, Demand, Assimilative capacity, Air, Land.
Identifiers: *Production, *Consumption, *Economic growth, Balance of payment, Recycling, Employment.

The existence of a mutual interdependence between economic policy and environmental policy is proposed on the basis that production-consumption and waste emission are joint human products. Illustration is provided by a theoretical astronaut lost in space, and a Harrod type model. The astronaut analogy is presented to clarify optimal rate of consumption theories. The Harrod model is presented to indicate the rate of consumption over time and to further support the theory of interaction between the economy and the natural environment. Empirical analyses are made of the effect of effluent charges of certain countries on their comparative international advantage. Particular attention is given to waste generation, and the finite characteristic of natural resources. This article is relevant to all the fields of natural resources, encompassing water, air, and land resources. (Murphy-Rutgers)

THE USE OF STANDARDS AND PRICES FOR PROTECTION OF THE ENVIRONMENT,
Princeton Univ., N.J.
William J. Baumol, and Wallace E. Oates.
Swedish Journal of Economics, Vol 73, No 1, Mar 1971. p 42-54.

Descriptors: *Prices, *Taxes, *Government, *Environmental quality, Marginal cost, Social aspects, Costs Profits, Optimization, Pollution, Decision making, Public utilities.
Identifiers: *Subsidies, *Resource allocation, *Externalities, Social welfare employment, Inflation.

A means is suggested of achieving certain environmental standards that establish arbitrary levels of environmental quality. The method calls for imposition of charges on waste emissions sufficient to achieve these standards. The optimality properties and other advantages of the proposed pricing procedure are presented, and it is indicated that this particular method will achieve the desired reduction in pollution at minimum cost to the economy. The pricing and standards method proposed is contrasted with the Pigouvian technique of imposition of taxes or subsidies on externality-generating activities, and the former is shown to be more readily workable for somewhat the same effect. Projections for the success of the standards and pricing method are made, indicating a definite reduction in environmental pollution which aids in approaching optimal resource allocation. This method is relevant to the maintenance of the quality of water resources. (Murphy-Rutgers)
W71-09900

ENVIRONMENTAL CONTROL AND ECONOMIC SYSTEMS,
Handelshogskolan i Stockholm (Sweden).
Erck Dahmen.
Swedish Journal of Economics, Vol 73, No 1, March 1971, p 67-75.

Descriptors: *Environmental quality, *Economic analysis, Costs, Technology, Prices, Profits, Resource allocation, Decision making, Investment, Time.
Identifiers: *Capitalism, *Socialism, Charges, Regulation, Production, Growth, Public goods, Incentives, Socio-economic costs.

Environmental deterioration in countries with different economic systems is characterized. It proposes various methods to solve such difficulties in the different systems. Since the analysis is concerned with the basic causes of environmental pollution, the remedies proposed are relevant to the correction of water pollution problems in the United States. The cause of environmental pollution is industrialization and therefore is present in both a capitalistic and socialistic economy. A major factor in the failure of both systems to combat pollution has been inaccurate cost calculations, which has been responsible for misallocation of resources and environmental deterioration. Accurate cost calculations would encourage the choice of technological alternatives favorable to preserving the environment. Regulations are suggested as an alternative to charges for effective environmental policy compliances. (Murphy-Rutgers)

CANADIAN SCIENTIFIC PROGRAMS FOR OPTIMUM MANAGEMENT OF GREAT LAKES WATER RESOURCES,
Department of Energy, Mines and Resources, Ottawa (Ontario).
A. T. Prince, and J. P. Bruce.
In: Proceedings, Twelfth Conference on Great Lakes Research, Ann Arbor, Braun-Brumfield, Inc., 1969, p 877-882.

Descriptors: *Water resource development, *Great Lakes, *Economic analysis, *Management, Water quality, Erosion, Water supply, Shipping, Government, Eutrophication, Pollution, Recreation, Sewage, Waste treatment.
Identifiers: Socio-economics, Power plants.

A survey is presented of Canadian activities to promote optimum management of Great Lakes water resources. Problems dealt with include fluctuating water quantities, shore erosion, and deteriorating water quality. Economic solutions and implementaton for them are being sought by various government agencies, academic personnel and private organizations and individuals. Research for longer term problems and international aspects of management and shipping remains the domain of the federal agency. There is a survey of the research activities of the Canada Centre for Inland Waters, an organization responsible for major lake research. Recent research program developments are dealt with, giving particular attention to the areas of water balance, erosion, water quality, waste treatment, and hydrology. Coordination of research and data collection both with Canada and internationally is cited. Suggestions for the future propose that research activity respond to management needs and managers use immediatly relevant research results. (Murphy-Rutgers)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

A SELECTED ANNOTATED BIBLIOGRAPHY ON THE ANALYSIS OF WATER RESOURCE SYSTEMS, SECOND VOLUME.
Cornell Univ., Ithaca, N. Y. Water Resources and Marine Sciences Center.

Compiled by Carol Kriss and Daniel P Loucks Available from the National Technical Information Service as PB-200 727, $3.00 in paper copy, $0.95 in microfiche. Publication No 35, Water Resources and Marine Sciences Center, Cornell University, Ithaca, N Y, June, 1971, 253 p, 401 ref. OWRR Project W-111 (No1613) (1).

Descriptors: *Bibliographies, *System analysis, *Water resources, Optimization, Simulation analysis, Operations research, *Abstracts, Forecasting, Planning.

Presented is an annotated bibliography of some recent selected publications pertaining to the application of systems analysis techniques for defining and evaluating alternative solutions to water resource problems. This publication is a supplement to the annotated bibliography having the same title and published by the Cornell University Water Resources and Marine Sciences Center in August, 1969 (Publication No. 25). Most of the 400 references included in this volume were published during 1969 and 1970. Publications for 1971 are not included. Both subject and author indices are provided. Keywords (descriptors) are listed at the end of each abstract. The abstracted material emphasizes the application of optimization and simulation techniques for assisting in the planning and management of water resource systems.

A GENERALIZED PROBABILISTIC APPROACH TO REGIONAL WATER SUPPLY ASSESSMENT,
Environmental Dynamics, Inc., Los Angeles, Calif.
John A. Dracup, Sharon G. Grant, Miguel A. Cardenas, and Thomas J. Fogarty.
Available from the National Technical Information Service as PB-200 999, $3.00 in paper copy, $0.95 in microfiche. Completion Report, December 1970, 125 p, 5 fig, 65 ref, 4 append. OWRR Project C-1410 (No 1980) (1).

Descriptors: *Runoff, *Precipitation (Atmospheric), *Water supply, Mathematical models, *System analysis, Rainfall-runoff relationships, *Regions, Planning, *Model studies.
Identifiers: *Regional water supply assessment.

A methodology is developed to predict available water supply levels for a region. Using the technique of system identification the relationship between precipitation and runoff is mathematically modeled by a non-linear, time-variant system of partial differential equations derived from a kinematic wave formulation. The theoretical model is adapted to a particular watershed using parameter identification techniques. The development mathematical model is utilized to generate runoff data from long term precipitation data. The methodology is particularly applicable to regions of long term precipitation data but limited streamflow runoff data. Predictions of available regional water supply can be made through the use of confidence interval estimations.

WASTE WATER TREATMENT PLANTS.
Federal Water Pollution Control Administration, Washington, D.C.

In: Public Facility Needs, Washington, US Government Printing Office, 1966, p 175-183.

Descriptors: *Waste water treatment, *Government, Watercourse, Pollution, Sewers, Capital, Population, Costs, Financing, Economic analysis, Effluents, *Treatment facilities.
Identifiers: *Public works, User charges, Construction costs, Operating costs, Growth rates.

A study of waste water treatment plants is presented. The necessity for such facilities is cited to protect the public health from waterborne disease, to prevent nuisances, and to prevent or abate public watercourse pollution. The nature and composition of the waste water treatment plants are delineated through a description of the physical characteristics and standard of performance, and a discussion of existing capital plant in the United States. The construction and operating costs of the plants are presented, as well as the user charges for the facility. Annual expenditures for sewage treatment plants is included in a presentation of trend of capital outlays, which discusses various forms and sources of financing. Capital requirements and potential financing methods are included in a presentation of the needs and prospective capital outlays for waste treatment provision. The projection includes both cost estimates and an analysis of population factors. (Murphy-Rutgers)

REGIONAL ECONOMIC DEVELOPMENT: THE RIVER BASIN APPROACH IN MEXICO,
New York Univ., New York.
David Barkin, and Timothy King.
Cambridge, England: Cambridge University Press, 1970, 262 p.

Descriptors: *River basin development, *Resource allocation, Evaluation, Hydroelectric power, Project evaluation, Cost-benefit analysis, *Regions.
Identifiers: *Regional growth, Social cost, Social overhead capital, Internal rate of return, Linkage effect, Externalities, *Mexico.

This book considers the strategy of promoting regional development through river basin schemes using Mexico as a case study. The first section outlines the economic and political rationale for using integrated river basin schemes to carry out public investment in irrigation and hydroelectric projects. The Mexican River Basin Commissions represent an attempt to coordinate government expenditure under a semi-independent agency on a regional basis. The river basin projects are considered not only in terms of their contribution to increasing aggregate national income but also the effect of the projects on the supply of factors of production. The achievement of the river basin approach with respect to the absorption of unemployed and underemployed labor and natural resources is found to be unsatisfactory. The authors conclude that the river basin approach should be supplemented by other regional policies to achieve regional development. (Siegenthaler-Rutgers)

A NATIONAL URBAN WATER RESOURCES RESEARCH PROGRAM.
Office of Water Resources Research, Washington, D.C.

Available from Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $0.35. (Proceedings), Mar 17-19, 1970, Georgia Institute of Technology, 1971, 54 p, append.

Descriptors: *Urbanization, *City planning, *Decision making, Social change, Aesthetics, *Water resources development.
Identifiers: *Metropolitan water resources management, *Water resoruces research, Urban ecology.

This report presents a program of research designed to improve water resources management in the urban environment. The proposed research program calls upon the physical, social, biological, and engineering sciences to develop knowledge required to shape solutions to present and future water problems in urban areas. Technology has a dual importance in this field: (1) the development, construction, and operation of physical works and equipment, and (2) the performance of urban water resources research. More information is needed on the hydrologic, biologic, and ecologic effects of urbanization, as well as means of measuring aesthetic and ecologic values against other tradition values. Research is also needed on the organization, determination of roles, the function and relationship of urban water resources institutions. The charge to OWRR is to identify research needs, to make these known, and to stimulate others to do research. What is clearly needed in the field of urban water resources research encompasses a broad range of problems. Significant results will depend on participation, cooperation, and coordination among Federal, State, and local governmental agencies, by the academic community, by industry, by private consultants and others qualified to conduct research. THE FUNCTION OF SOCIAL BEHAVIOR IN WATER RESOURCE DEVELOPMENT.
Utah State Univ., Logan. Inst. for Social Science Research on Natural Resources.
Wade H. Andrews, and Dennis C. Geersten.
Available from the National Technical Information Service as PB-200 725, $3.00 in paper copy, $0.95 in microfiche. Center for Water Resources Research Report No 1, Utah State University, Logan, Utah, Dec 1970. 124 p, 2 fig, 55 tab, append. OWRR Project A-001-UTAH (7).

Descriptors: *Water resources development, Social aspects, *Attitudes, *Social values, *Planning, Decision making, Technology, Social change.
Identifiers: *Social behavior, Bear River Project, *Environmental problems.

Many water resource engineers and planners have indicated that some of the most difficult problems in successful water resource development relate to social problems. Social value alternatives, such as conservation, aesthetics, and recreation are involved in the choices of development, but cannot be easily quantified in economic terms. The present study deals with the effects of a proposal for the technological development of a water resource; in this case, The Bear River Project. The broad objectives of this exploratory work are: (1) to determine the social psychological value patterns affecting

water resource development; and (2) to determine how basic cultural and social organizational arrangements are interrelated in motivations and attitudes and affecting the development and use of water. One of the attitudes investigated in the study was concerned with whether interbasin transfer of water was right or wrong. Attitudes toward water use by various categories of residence provide insight into the location of likely support for future project proposals. It is expected that the broad exploratory nature of this study will provide a useful background for other studies with more specialized and limited goals. (Wray-Chicago)

A GEOGRAPHICAL MODEL FOR POLITICAL SYSTEMS ANALYSIS,
Clark Univ., Worcester, Mass. Graduate School of Geography.
Saul B. Cohen, and Lewis D. Rosenthal.
Geographical Review, Vol 61, No 1, p 5-31, Jan 1971. 3 fig, 28 ref.

Descriptors: *Systems analysis, *Political aspects, *Model studies, *Institutional constraints.
Identifiers: *Political process, *Geographical model, Venezuela.

The literature of contemporary political geography is wanting in methodological approaches by which general theory and hypotheses can be developed and tested. It is proposed that political geographers turn more directly to political processes and to the spatial consequences than has heretofore been the case, and that their efforts be cast within a political-geographical systems framework. The major points for analysis of political process are the political system, locational perspective, and the open/closed political system. A basic objective of analyzing process in a spatial context is to examine man's behavior in space. The force and extent of political action areas and counteraction areas are expressed by various measures of political socialization. What creates an action area is the acceptance of political policy by groups that count politically and the attendant social and economical consequences. A political systems model, Venezuela's petroleum and immigration transactions, is examined showing that the law-landscape thread is a key to the analysis of political system. The specific transactions discussed here have been viewed as elements in the total political process. The political systems model proposed here can serve as the analytical framework for an understanding of the relationship of process to geographical space. (Wray-Chicago)

COMPREHENSIVE WATER RESOURCES MANAGEMENT--THE PAST AND THE FUTURE,
Department of the Interior, Washington, D.C.
Everett A. Gordon.
Water Resources Bulletin, Vol 7, No 1, p 185-188, Feb 1971.

Descriptors: *Water resources development, *Environment, *Political aspects, Inter-agency cooperation, Economics.
Identifiers: *Water resources planning, *Environmental quality, Colorado River Basin, Environmental Protection Agency, Federal Water Quality Administration.

The historic approach to American water problems has been characterized by artificial separation of water quantity and water quality--often completely ignoring water economics. This separation is at all levels of government, with the resources management responsibility so divided that only through great effort to coordinate diverse programs and operations is the goal of comprehensive water resources management approached. It is apparent that water quality considerations should play a significant role in management decisions concerned with quantity. In dealing with water resources development the Congress is attempting to coordinate all levels of government action. Among professionals, academic training provides only a narrow discipline orientation. The best approach to water problems lies in unified and comprehensive management agencies that assemble all of the knowledge, ability, techniques, disciplines, and resources needed to accomplish the management job. THE EXPANDING CITY,
Northeastern Illinois Planning Commission, Chicago.
Matthew L. Rockwell.
Environmental Geology Notes, Illinois State Geological Survey, No 46, p 25-31, May 1971.

Descriptors: *City planning, *Decision making, Management, Inter-agency cooperation, Social change, *Planning.
Identifiers: *Metropolitan areas, Public policy, Comprehensive planning, Northeastern Illinois Planning Commission.

The physical development and deterioration of metropolitan areas is discussed. Public improvement programs for metropolitan areas often are severely inadequate because of insufficient planning for growth and contradictions in objectives. Private improvements are usually more disorganized than in the public sector with private developers influenced by profit potential and zoning regulations. Land use problems are all conflicts between one human activity and another; we are crowded together and yet too far apart for convenience and efficiency. The Northeastern Illinois Planning Commission has a comprehensive plan which calls for a stronger mass transportation system, industrial development, and opportunity for each person to improve his cultural, social, and economic conditions. Recommendations are directed to improving planning agencies and to recognition of the special problems of cities. (Wray-Chicago)

THE DEVELOPMENT AND USE OF COAL SURFACE - MINED LANDS IN ILLINOIS,
Midwest Coal Producers Inst., Springfield, Ill.
L. S. Weber.
Environmental Geology Notes, Illinois State Geological Survey, No 46, p 41-46, May 1971.

Descriptors: *Land use, *Mining, *Water resource, Development, *Recreation, Reclamation, *Illinois.
Identifiers: *Coal surfaced-mined lands, Environmental quality.

Reclamation of surface-mined lands dates back to 1920. Methods of reclamation include tree growth, forage production (seeding), recreation (primarity associated with water areas), multiple and intensive use. Tree growth was an early development, by natural seeding or planting. In 1964 a more scientific approach to tree planting was initiated. In forage production, mined lands are used for pasture by seeding and fencing. Recreational use of water areas created by mining operations is often hampered by water pollution. The use of strip-mined areas for waste disposal (land fill) is becoming important. The new method of sludge disposal from metropolitan sanitary plants is being researched. Multiple use is evidenced in the use of forage areas for hunting and of the forest areas for camping and other recreational activities. Examples of intensive use that can and will be expanded are homesites and industrial or business developments. (Wray-Chicago)

WATER RELATED ENVIRONMENTAL SERVICES.
Central New York Regional Planning and Development Board, Syracuse.

Available from the National Technical Information Service as PB198 086, $3.00 in paper copy, $0.95 in microfiche. Local Planning Agency technical report, Syracuse N.Y., Nov 1970. HUD Project NYP. 200.

Descriptors: *Regional analysis, *Planning, *Water supply, *Water pollution, Drainage, Flood control, Sewers, Water consumption, New York.
Identifiers: *Cayuga County New York, *Cortland County New York, *Madison County New York, *Oswego County New York, *Onondaga County New York.

This report summarizes the analysis phase of water supply, sewage disposal, storm drainage, and flood control in the Central New York Region. Present and expected problems of service quality and quantity have been examined along with potential measures to alleviate these problems and ungrade service. Interservice and service-to-environment relationships, involving such factors as environmental quality, benefit-cost considerations, economics of scale, and inertie arrangements, were noted throughout the analysis. The analysis included an examination of the various possible solutions to each locale's needs; some of the more involved alternatives are dealt with in detail.

METHODS FOR PROTECTING AREAS OF WATER ORIGIN,
Colorado River Commission of Nevada.
Ivan P. Head.
Proceedings of the Western Interstate Water Conference, Strategies for Western Regional Water Development, Corvallis, Oregon, 1965. p 125-130.

Descriptors: *Water resources development, *Regional analysis, *Project planning, Cost-benefit analysis.
Identifiers: *Feather River Project, Pacific Southwest Water Plan, Western States Water Council.

The author states the case for the development of a comprehensive Western Water Plan which would combine the requirements and resources of all the western states. He explains that in the past three methods have been used to protect the areas of water origin, namely recapture statutes, political muscle and regional planning. He argues that regional planning has the most benefits. (Holmes-Rutgers)
W71-09685

PLANNING FOR WESTERN REGIONAL WATER DEVELOPMENT,
California Univ., Los Angeles.
Ernest A. Engelbert.
Proceedings of the Western Interstate Conference, Strategies for Western Regional Water Development, Corvallis, Oregon, 1965 p 17-62. 3 fig, 2 tab, 57 ref.

Descriptors: *Water resources development, *Project planning, *Economics, *Federal finance.
Identifiers: *West, California State Water Plan, Colorado Basin, Pacific Southwest Water Plan, Snake - Colorado Project.

The author summarizes the major issues facing planners of water resource use in the western states. Whereas before 1965, U.S. water resource development was devoted primarily to the western states, the future promises more national concern with the subject. He discusses problems of planning, financing, priorities, and type of water resources development. (Holmes-Rutgers)
W71-09697

A CASE STUDY OF WATER RESOURCES DEVELOPMENT - AN ANALYSIS OF A PROPOSED PROJECT ON THE MISSOURI RIVER,
Cornell Univ., Ithaca. Water Resources and Marine Sciences.
Lawrence S. Hamilton, and Carlos D. Stern.
Technical Report No 28, April 1971, 2 p. OWRR Project A-024-NY (2).

Descriptors: Alternative costs, Annual benefits, Annual costs, Economic feasibility, *Economic justification, *Evaluation, *Hydroelectric power, *Missouri River, Montana (Multiple purpose projects), *Political aspects, Power marketing, *Recreation, *River basin development, Water resources, *Water resources development, *Wild rivers.

As a result of the analysis it is concluded that the 'Joint Report on Water and Related Land Resources for Missouri River, Fort Benton to Vicinity of Fort Benton, Montana, June 1963' fails to provide the decision maker with the range of information he would require and fails to provide a sufficiently accurate economic assessment of the benefits and costs to the Nation. Factual and conceptual inadequacies have been revealed. Factual inadequacies concern: use of reconnaissance data to formulate specific benefit and cost figures; uncertainties as to streamflow and evaporation loss; failure to include evaporation loss as a cost; failure to include reservoir filling as a cost; failure to include surge tanks and afterbays as costs; a rather amazingly low estimate for a bridge at the Judith River; a misleading figure for the mileage of the remaining stretch of wilderness waterway; inadequate consideration of the unstable nature of the Missouri Break rock formations; failure to account for or describe the scenic loss due to inundation; unsatisfactory methods of assigning recreation benefits; use of replacement flood control as a benefit of dams; use of 1957 data for power anslysis. Conceptual inadequacies concern: several of the eleven supposed alternative proposals are redundant and obscure clear choice; there is an assumption that there are no alternative uses for money not employed in maximum physical development of the river; lack of consideration of marginality with the assumption of unsatisfied, constant demand for any produce or service; failure to establish a need for peaking power or to study transmission costs. The study also concludes that the independent review process for such project development proposals is inadequate, being carried out by the Board of Engineers for Rivers and Harbors, Federal Power Commission, and the Missouri Basin Inter-Agency Committee. It is hoped that the Water Resources Council can adequately fulfill this role.

STATE AND FEDERAL OUTDOOR RECREATION FACILITIES.
Department of the Interior, Washington, D.C. Bureau of Outdoor Recreation.

In: Public Facility Needs, Washington, US Government Printing Office, 1966, p 520-531.

Descriptors: *Recreation, *Water resource development, *Economic analysis, Multiple purpose projects, Forests, Fishing, Swimming, Costs, Taxes, Capital, Financing, Government.
Identifiers: *Public facilities, *Developed facilities, User charges, Entrance fees.

A study is presented of two types of Federal and State recreation facilities, namely developed facilities and natural resources of land and water. Areas included encompass parks, forests, fishing and hunting areas, reservoirs, and picnic areas, all of which are discussed for both recreational value and economic worth to nearby communities. The recreation facilities are described, and the existing capital plant for such facilities is presented. Construction and operating costs are presented, with reference made to the wide variance caused by location, terrain, and facility design. User charges are broken down into campbround charges, entrance fees, user fees, and taxes. The trend of capital outlays is treated, with special attention being given to sources of financing for the recreation facility. The future needs and prospective capital outlays are forecast according to capital requirements and available sources of financing, such as taxation and the land and water conservation fund. (Murphy-Rutgers)

ECONOMIC DECISION MODELS,
Oregon State Univ., Corvallis.
James L. Riggs.
New York, McGraw-Hill, 1968, 401 p.

Descriptors: *Decision-making, Economic evaluation, Operations research, Marginal cost, Resource allocation, Linear programming, Risk, Uncertainty probability, Game theory, Interest rate.
Identifiers: *Economic decision models, Econometrics, Opportunity cost, Break-even analysis, Gantt chart.

This book is essentially a quantitative approach to practical management and government problems but also considers the theoretical and nonquantitative aspects of decision-making as well. The author outlines deterministic decision-models and then discusses probabilistic models. The use of linear programming to deal with resource allocation problem is illustrated through examples. Techniques such as cost-benefit analysis and the payback method are used to lead to a time evaluation of strategic projects. The author then considers decisions recognizing risk. Concepts of risk are defined and the effect of variability on the decision problem is recognized. Probabilistic models such as expected utility, discounted-decision trees, queuing and simulation are considered. The final decision models dealt with are those project evaluations made under uncertainty using game theory techniques. This book is relevant to water research concerned with decision-making and project evaluation. (Siegenthaler-Rutgers)
W71-09868

THE WORLD OF WATER,
Minnesota Univ., Minneapolis.
William C. Walton.
New York, Taplinger Publishing Company, 1970, 317 p.

Descriptors: *River basin development, Cost-benefit analysis, *Economic evaluation, *Water demand, Groundwater, Aquifer, Water pollution, Social welfare, Reimbursement, Decision-making.
Identifiers: *Water-based recreation, Water resource management, Opportunity cost.

This book considers the economic, legal, social, and physical aspects of water resource planning and management. The role of economic policy, reimbursement, and project evaluation in planning water development programs are discussed. The geologic problems concerned with groundwater are noted in conjunction with aquifer conditions. Five concepts of river basin development are outlined: multiple-storage project, basinwide management, comprehensive regional management, articulated land and water programs with unified administration. The author discusses various criteria that are used in decision-making for river basin planning including cost-benefit analysis, social criteria, political constraints and the physical environment and hydrologic criteria of feasibility. Examples of river basin planning in the United States and Germany are presented along with research studies that are used in comprehensive planning. (Siegenthaler-Rutgers)

DECISION MAKING THROUGH OPERATIONS RESEARCH,
Xavier Univ., Cincinnati, Ohio.
Robert J. Thierauf, and Richard A. Grosse.
New York, John Wiley and Sons, Inc, 1970, 570 p.

Descriptors: *Decision-making, *Operations research, Linear programming, Nonlinear programming, Uncertainty, Dynamic programming, Probability, Optimization, Game theory, Economic evaluation, Systems analysis.
Identifiers: *Heuristic programming, PERT, Decision tree Lagrange multiplier, Objective function, Matrix algebra.

This book considers available techniques of operations research that are readily applicable for decision-making. The author surveys quantitative methods, background material in probability theory and matrix algebra as a preparation for the application of decision-making models. Methods for dealing with decision-making under uncertainty are presented. The Program Evaluation and Review Technique (PERT) is outlined with its advantages and disadvantages discussed through use by government agencies. Optimization models are considered and distinguished from iterative models that search through many alternative courses of action for an optimal solution. The techniques of linear programming, nonlinear programming, dynamic programming, game theory, and Markov analysis are presented. Future trend in operations research are discussed with stress placed on heuristic programming. This book is relevant to water studies concerned with the application of operations research techniques to decision-making. (Siegenthaler-Rutgers)
W71-09871

SOME NEW APPROACHES TO RISK,
Pittsburgh Univ., Pa.
R. Bryne, A. Charnes, W. W. Cooper, and K. Kortanek.
Accounting Review, Vol 43, No 1, Jan 1970, p 18-37.

Descriptors: *Risk, Operations research, *Decision-making, *Probability, Capital budgeting, Linear programming, Sensitivity analysis, Economic evaluation.
Identifiers: *Chance-constrained programming, Payback period, Decision tree, Algorithm.

Newer methodological approaches to risk, conceptualized by information in the form of probability distributions, and considered. Some of the approaches proceed by reference to a single-figure-of-merit optimization while others are concerned with the explicit consideration of risk. The latter approaches such as linear programming and chance constrained programming are illustrated with example using different assumptions about the state of information for decision-making. Chance constraints can serve as a feasibility check on previous decision assumptions relative to risk policies. Examples of models including both rate of return and payback as well as risk are given for evaluating prospective projects. This paper is relevant for water research concerned with the application investment decision-making in the presence of undercertainty. (Siegenthaler-Rutgers)
W71-09872

RISK ANALYSIS IN PROJECT APPRAISAL,
International Bank for Reconstruction and Development, Washington, D.C.
Louis Y. Pouliquen.
Baltimore, Johns Hopkins Press, 1970, 79 p.

Descriptors: *Project evaluation, Risk, Resource allocation, Decision-making, Probability distribution, Cost-benefit analysis, Sensitivity analysis, Costs, Simulation, Correlation, Elasticity of demand.
Identifiers: *Rate of return, Present worth, Beta distribution, Growth rate.

This book discusses the applications of risk analysis to project appraisal based on World Bank examples. The methodology is illustrated through the case study of the Port of Mogadiscio. Initially, cost-benefit analysis was used but proved inadequate and sensitivity analysis was then used to narrow the sources of uncertainty in the variables. A risk analysis with cumulative probability distributions was used to deal with uncertainties and to generate economic rates of return. The author then considers some of the problems of risk analysis, namely, the correlation among variables, the choice of a probability distribution, and the means and cost of risk analysis. The conclusions of one study are that risk analysis is a useful technique for handling marginal projects, unusual uncertainties, optimization of project specifications, and project identification. This book is relevant to water research concerned with the role of risk in project evaluation. (Siegenthaler-Rutgers)

SYSTEMS ANALYSIS AND PROJECT MANAGEMENT,
Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.
David I. Cleland, and William R. King.
New York: McGraw-Hill, 1968, 307 p.

Descriptors: *Systems analysis, *Planning, Decision-making, *Evaluation, Resource allocation, Operations research, Optimization cost-benefit analysis, Planning-Programming-Budgeting, Network design.
Identifiers: *Information system, Isocost line, PERT, Cantt chart.

This book presents systems analysis and project management in a form that demonstrates their applicability to a variety of governmental managerial environments. A conceptual framework for systems analysis is outlined that relies on the outcome array as a basic tool. The authors then consider the role of models in systems analysis and use cost-benefit analysis to illustrate the application of models to decision-making. The relationship between programming-planning-budgeting and systems analysis is outlined. The authors then discuss techniques for use in the planning and control of a particular project. Network planning is used to depict the interrelationship between activities and events and the sequence in which they are to be accomplished. The PERT method is utilized to convert time estimates for plan completion to an expected activity time. This book is relevant to the water administrator concerned with project planning and control. (Siegenthaler-Rutgers)

BENEFITS AND BENEFICIARIES: CONTRASTING ECONOMIC AND CULTURAL DISTINCTIONS,
Oregon State Univ., Corvallis.
Courtland L. Smith, and Thomas C. Hozg.
Water Resources Research, Vol 7, No 2, April 1971, p 254-263.

Descriptors: *Water resource investment, Cost-benefit analysis, Evaluation, Optimization, *Decision making, Cost, Economic efficiency.
Identifiers: *Beneficiary, Benefactor, Role, Reciprocity, Subsidy, Income distribution.

The importance of the social and cultural context for water resource development decision making is considered. The authors examine cost-benefit analysis, an evaluative process for determining the ratio of benefits to costs in economic terms, which when translated into social terms considers the role of beneficiary or benefits and benefactor or costs. Comparative observations of peoples of the Pacific Northwest, Salt River Valley of Arizona, and the Sahara desert of Africa and their role in resource development show interesting differences in the nature of role performance relative to receipt of water resource benefits and repaying the cost of creating these benefits. The authors conclude that cost-benefit analysis is not an objective value free logical system, but it is a logical system conceived to optimize a unique set of cultural values. (Siegenthaler-Rutgers)
W71-09884

A PLANNING APPROACH TO THE PUBLIC GOOD PROBLEM,
Institute National de la Statistique et des Etudes Economiques, Paris (France).
E. Malinvaud.
Swedish Journal of Economics, Vol 73, No 1, Mar 1971, p 98-112.

Descriptors: *Planning, Budget constraints, Tax, *Decision making, Welfare economics, Demand.
Identifiers: *Public good, Equity, Collective consumption, Pareto optimal, Willingness to pay.

The theory of planning is used to deal with the problem of how to achieve an optimal provision of public goods. The model used has two consumers and two commodities (one public and one private good). First, the solution suggested by E. Lindahl is discussed as a part of the planning approach and found to be unsatisfactory from equity standards. The author modifies this solution to satisfy the equity provisions. Procedures using quantity indicators were then used and consideration was given to three requirements: convergence to an optimum, equitable treatment of the two consumers, and incentives for correct revelation of preferences. It was found that procedures using quantity indicators were more effective than procedures using tax indicators. This paper is relevant to water research concerned with the theory of planning and public goods. (Siegenthaler-Rutgers)

URBAN LOCAL OUTDOOR RECREATION FACILITIES,
Department of Housing and Urban Development, Washington, D.C.
Jack A. Underhill.
In: Public Facility Needs, Washington, U.S. Government Printing Office, 1966, p 532-554.

Descriptors: *Recreation, *Capital, *Costs, *Financing, *Government, Beaches, Pools, Natural resource development, Government, Taxes.
Identifiers: *User charges, *Capital outlays, *Estimated needs, Recreation centers, Ownership, Expenditures.

Local, publicly owned facilities are discussed for outdoor recreation such as parks, playgrounds, beaches, pools, recreation building, and indoor recreation centers. The physical characteristics of such facilities are discussed, as are the services they render, and general guidelines for measuring their standards of performance. A discussion of existing capital plant includes national estimates, state distribution, and city distribution of the facilities discussed, as well as age, ownership and estimated current value of the facilities. Land acquisition, development, maintenance and operating costs precede a presentation of user charges that is broken down according to degree of use, extend of coverage, taxes, and borrowing. Trend of capital outlays includes local expenditure figures and cites such sources of capital as state, federal government, county, and private investment. A basis is given of projected needs of the facilities on a yearly basis, and according to community size, following which various sources for future financing are suggested. The important role of water use in outdoor recreation makes this article relevant to water based recreation studies. (Murphy-Rutgers)
W71-09892

SOME FACTORS ASSOCIATED WITH THE CEDLINE OF THE LAKE ERIE COMMERCIAL FISHING INDUSTRY IN OHIO,
Toledo Univ., Ohio.
Donald W. Lewis.
In: Proceedings, Twelfth Conference on Great Lakes Research, Ann Arbor, Braun-Brumfield, Inc, 1969, p 834-842.

Descriptors: *Lake Erie, *Fishing, *Economic analysis, Time, Costs, Economic efficiency, Technology, Population, Salting, Capital costs.
Identifiers: *Political factors, *Biological factors, Real value of catch, Storage, Freezing.

The problems associated with the decline of the commercial fishing industry on Lake Erie in Ohio are considered. The real value of the fishing catch is used as a measure of the state of the industry. An analysis of the timing places the start of the decline about 1943. The adverse effect of the changing fish population is considered a factor, although this is thought to be one of the lesser causes. Competition for the Ohio industry is categorized as largely between sportsmen and the Ontario commercial industry. Problems of competitive labor costs, labor productivity, permissive regulation, and stagnant technology are also cited. The industrial structure is characterized as weak and market competition from non-fish protein sources and freshwater fishery products is indicated as a strong factor contributing to the decline. The concluding remarks blame economic and political factors for the decline of the industry, in which biological factors

have also contributed a noticeable deleterious effect. (MurphyzRutgers)

COMPREHENSIVE WATER RESOURCES PLANNING--ITS IMPLICATIONS FOR FISH AND WILDLIFE RESEARCH AND MANAGEMENT,
Bureau of Commercial Fisheries, Ann Arbor, Mich.
Robert L. Scheuler.
In: Proceedings, Tenth Conference on Great Lakes Research, Ann Arbor, Braun-Brumfield, Inc., 1967, p 447-455.

Descriptors: *Water resources development, *Planning, *Great Lakes, *River basins, Government, Decision making, Flood control, Water supply, Navigation, Pollution, Fishing, Budgets, Forecasting.
Identifiers: *Comprehensive approach, Multiple-usage, Economic growth, Hydro-electric power.

The interests and research of the fish and wildlife biologist are correlated with comprehensive water resources planning of river basins. The history of such planning is surveyed and the development of water resources activities for the Great Lakes area is given special attention. A discussion of the implementation of the water resources planning is presented and such implementation is then related to the work and interests of the individual and agencies primarily concerned with fish and wildlife research and management. Indication is that this last section can also apply appropriately to many other water-related disciplines. Topics dealt within the study include multiple-usage of the water facilities, demand for water and land-related resources, Flood control, water supply, water quality, navigation, hydro-electric power, and outdoor recreation. Project needs, authorizations and projections are also discussed in light of their contribution to economic growth. (Murphy-Rutgers)

PUBLIC GOODS AND INCOME DISTRIBUTION,
Maryland Univ., College Park.
Henry Aaron, and Martin McGuire.
Econometrica, Vol 38, No 6, Nov 1970, p 907-920.

Descriptors: *Taxes, *Marginal utility, Economic efficiency, Resource allocation, Sensitivity analysis, Costs.
Identifiers: *Income distribution, Public good, Externalities, Utility function, User charge.

An alternative approach is presented to the measurement of the benefits and burdens of government expenditures on public goods. Previous studies of the distributional effects of public budgets have not acknowledged that allocation of the benefits of public goods depends on an assumed utility function. This study shows that the impact of the budget on income distribution cannot be evaluated unless a utility function is employed to estimate public good income. The choice of the utility function critically influences the results. The authors find that studies that focus on income brackets alone obscure some distributional questions and that a more fruitful approach should take account of the distributional impact of public budgets among groups defined not only on the basis of income but on economic, social, and demographic characteristics as well. This paper is relevant to water research concerned with the effect of water research projects on income distribution. (Siegenthaler-Rutgers)

CAPITAL ALLOCATION THEORY: THE STUDY OF INVESTMENT DECISIONS,
University of Southern California, Los Angeles.
Gerald A. Fleischer.
New York, Appleton-Century-Crofts, 1969, 291 p.

Descriptors: *Evaluation, *Decision-making, Risk, Interest rate, Depreciation, Sensitivity analysis, Probability, Decision theory, Capital cost, Marginal cost.
Identifiers: *Capital budgeting, Equivalence theory, Present worth, Cash flow, Payback method, Rate of return, Annual cost.

This book first describes the capital budgeting problem and then discusses the principles that form the rational basis for capital budgeting procedures. The mathematics of compound interest are then derived and the principal techniques of economic evaluation: annual cost, present worth, and rate of return are discussed. Each of these methods considers the amount and timing of cash flows; they differ only with respect to the reference time used. Procedures for dealing with investment proposals that are mutually exclusive are outlined for the selection of the optimal project. The author then considers the effect of uncertainty and presents several techniques based on sensitivity analysis, decision theory and probability theory for dealing with risk and uncertainty in capital budgeting. The author presents various procedures for implementing the capital budgeting theory in decision-making. This book is relevant to water studies concerned with decision-making and project evaluation. PRIVATE COSTS OF USING PUBLIC GOODS,
Purdue Univ., Lafayette, Ind.
Robert A. Meyer, Jr.
The Southern Economic Journal, Vol XXXVII, No 4, Apr 1971, p 479-488.

Descriptors: *Costs, *Government, *Economic analysis, *Optimization, Model studies, Prices, Technology, Government supports, Income, Taxes.
Identifiers: *Quasi-public goods, *Private goods, *Rejectability, *Excludability, Equilibrium, Transfers, Consumption, Multipliers, Constraints.

An attempt is made to clarify the term 'exclusion,' to discuss public goods, and to analyze the properties of general equilibria attainable as the outcome of voluntary agreement in the presence of private costs of using quasi-public goods. Excludability should be considered symmetric to rejectability in dealing with commodities provided by governmental units. Various stipulations are proposed for a non-excludable, non-rejectable commodity to focus on rejectability and private user cost elements. The analysis is then extended to propose stipulations for a non-excludable but rejectable commodity, termed a quasi-public good. The private costs for such a good are then presented, followed by an analysis of subsidies, lump-sum transfers, and laws for altering consumption of the good. The formal optimality conditions associated with quasi-public goods are presented with and without user costs. Changes in welfare implications stemming from models including these goods are discussed, and the existence of a general equilibrium is established for a model including quasi-public goods and the associated prices for private goods. This paper provides insight into the public good aspect of water resources and should be of interest to theoretically oriented water research. (Murphy-Rutgers)

BEHAVIOR OF THE FIRM UNDER REGULATORY CONSTRAINT: NOTE,
Polytechnic Inst. of Brooklyn, N.Y.; and Hawaii Univ., Honolulu.
Israel Pressmar and Arthur Carol.
American Economic Review, Vol LXI, No 1, Mar 1971, p 210-212.

Descriptors: *Public utilities, *Economic efficiency, *Investment, *Rate of return, Prices, Government, Demand, Optimization, Capital, Profit.
Identifiers: *Regulatory constraint, *A-J effect, *Monopoly, Continuity, Marginal revenue product.

The 'A-J Effect', holding that a firm will tend to increase its investment with the introduction of an active constraint on its rate of return, is scrutinized. This effect was postulated both by the persons for which it is named (Averch and Johnson) and by Takayama. The authors of this article show that the 'A-J Effect' cannot be derived from the basic assumptions of the model since the assumptions used

require an assujption that the 'A-J Effect' exist in the first place. The model is presented and then analyzed in light of the assumptions involved, particularly the offending equations used to derive the conditions for continuity, which depend for their usefulness on the preexistence of the A-J effect. The authors then prove that the A-J effect is impossible without these two assumptions (which are invalid). This article is particularly relevant to the regulation of natural monopolies such as water utilities. (Murphy-Rutgers)

A NOTE ON SUPPLEMENTAL APPROPRIATIONS IN THE FEDERAL BUDGETARY PROCESS,
Carnegie Inst. of Tech., Pittsburg, Pa.
Gary W. Bowman, Otto A. Davis, Henry J. Gailliot, and Alan C. Hess.
In: The Planning-Programming-Budgeting System: Progress and Potentials, Washington, The U.S. Government Printing Office, 1967, p 252-262.

Descriptors: *Government, *Budget, Social aspects, Statistics, Correlation, Decision making, Financing, Model studies, Research.
Identifiers: *Supplementals, *Allocation process, Non-defense agencies, Behavioral model, Expectations receipts, Unemployment.

A report is presented on the research concerning supplemental appropriations as one type of sources for funds for the agencies of the United States government. Relevant aspects of the allocation of these appropriations to non-defense agencies are presented in a summary of findings by Davis, Dempster and Wildavsky. Several alternative behavioral models of the process of making supplemental appropriations are presented, and various empirical tests of these models are presented. In addition, two models reflecting macro considerations are discussed in contrast to the micro-oriented models first presented. Factors affecting supplementals may properly be excluded from the regular budgetary process, since these determinates are so agency-specific that unexpected contingencies would have to be predicted to deal adequately with the supplementals. This article is relevant to government appropriations receptors, particularly those involved with federal water resource projects. (Murphy-Rutgers)

CHARACTERISTICS OF HOUSEHOLD WATER CONSUMPTION IN THREE NEW HAMPSHIRE COMMUNITIES (APPENDIX),
New Hampshire Univ., Durham. Water Resources Research Center.
Richard A. Andrews, and Martha R. Hammond.
Research Report No 3, Statistical Appendix, December, 1970, 16 p, 17 ref, 3 append. OWRR Project A-018-NH (2).

Descriptors: *Water utilization, *Domestic water, *New Hampshire, *Water users, Water demand, Water costs, Lawns, Utilities, Water management (Applied), Water requirements, Cities.
Identifiers: *Household water consumption.

The purpose of this Appendix is to present a detail description of the study design and select estimated regression equations based on the highest R2 with the most number of significant variables for use by professional workers in water resources fields. Several regression equations for each community are presented for evaluation of the results of the study and to provide alternatives in selection of a most usable equation for some defined purpose. It is felt that no one equation would serve all purposes or be of sufficient explanatory power for developing of confidence in the estimates obtained when applied to practical problems. Each community is treated separately due to an apparent 'community' or 'neighborhood' influence. The study was not designed to test for this influence on water consumption. Only for Durham and Epping is the 'neighborhood' effect even modestly identifiable in statistical analysis. To test for 'neighborhood' effect, more identifiable neighborhoods would be required along with more information about the neighborhood and its boundaries. (See also W71-08323)

DROUGHT AND WATER SUPPLY - IMPLICATIONS OF THE MASSACHUSETTS EXPERIENCE FOR MUNICIPAL PLANNING,
Resources for the Future, Washington, D.C.; and Pittsburgh Univ., Pa. Dept. of Geography; and Clark Univ., Worcester, Mass. Dept. of Geography.
Clifford S. Russell, David G. Arey, and Robert W. Kates.
Research conducted under an RFF grant to Clark Univ. Baltimore, Maryland, The Johns Hopkins Press, 1970, $8.00. 232 p, 29 fig, 56 tab, 8 append.

Descriptors: *Water supply, *Droughts, *Massachusetts, *Water resources development, *Municipal water, Model studies, Planning, Water demand, Water yield, Water costs, Water shortage, Water storage, Reviews, Forecasting.

The drought in Massachusetts of 1962-66 was studied to determine the adequacy of community water supply systems in terms of physical structure and operation, and the capacity of communities to adapt to drought conditions. The data developed were in turn used in a model depicting the efficient expansion of an existing water supply system. This study is part of a small but growing literature which explores society's ability to cope with natural hazards. In making explicit the service capacity of a water system under drought conditions, by considering the curtailment of water use as an investment, and by expressing 'losses' in dollar terms, important options for future water system planning are developed. AN APPROACH TO THE PROBLEM OF ESTIMATING DEMAND FOR PUBLIC GOODS,
Stockholm Univ. (Sweden).
Peter Bohm.
Swedish Journal of Economics, Vol 73, No 1, Mar 1971, p 55-66.

Descriptors: *Demand, *Government, *Environmental quality, Costs, Taxes, Prices, Waste treatment, Lakes, Swimming, Fishing, Uncertainty, Statistics, Population, Social aspects.
Identifiers: *Estimation, *Public goods, McGuire-Aaron model, Incentives, Willingness to pay, Credibility.

A method is suggested for estimating the demand for such public goods, as environmental quality, when the decision-makers are unaware of the maximum willingness to pay in relation to costs as well as the willingness to pay in different consumer groups. The method is developed because consumers do not reveal their true preference for such public goods. A simplified example of the proposed method is presented, utilizing the problem of demand for waste treatment facilities to render a polluted lake suitable for swimming and fishing. The problems of credibility and incentives to distorted demand are surveyed, as is the problem of selection of an appropriate population sample. The pure theory of public goods is then presented, including the McGuire-Aaron model, the supply of public goods, and policy costs. Finally, there is a treatment of the problem of selecting optimal procedures for estimation of demand for public goods. (Murphy-Rutgers)

PERMITS FOR WORK IN NAVIGABLE WATERS.

Federal Register, Vol 35, No 2, p 79-81 (Jan 1970). 3 p.

Descriptors: *Permits, *Navigable waters, *Structures, *Administrative agencies, Navigation, Water pollution, Water pollution control, Pollution abatement, Fish, Wildlife, Fish conservation, Wildlife conservation, Conservation, Environmental effects, Ecology, State governments, Local governments, Regulation, Adjudication procedure, Administration, Administrative decisions.

The Corps of Engineers has amended its regulations governing work to be performed in navigable waters. Issuance of permits must be based upon consideration of all relevant factors, including the effect of the proposed work on navigation, fish and wildlife, conservation, pollution, aesthetics, ecology, and general public interest. As to permits for construction of fixed structures on the Outer Continental Shelf, the decision will be based on the effect upon navigation and national security. However, even when the structure is unobjectionable, if state and local authorities decline to consent to the work, a permit will not be issued. In such cases the applicant will be informed that a permit would be issued if local consent were forthcoming. The amendment also provides detailed requirements for furnishing notice to the public and interested parties, and for consultation with interested parties. Requirements for public hearings and the procedures to be followed at such hearings are also set forth in detail. (Hart-Florida)

POWERS OF CITIES: WATER MANAGEMENT AND POLLUTION CONTROL.
Revised Code of Washington Ann secs 35.22.280, 35.23.440, 35.24.290 (1965).

Descriptors: *Washington, *Water pollution control, *Municipal water, *Cities, Water pollution, Water quality control, Pollution abatement, Public health, Bridges, Bridge construction, Sewers, Streams, Lakes, Canals, Ponds, Ponding, Legal aspects, Legislation.

These sections enumerate the powers granted to cities of the first, second, and third classes. First and second class cities are empowered: (1) to control and punish pollution of all streams within five miles of their corporate limits, and of any stream or lake used for municipal water supply, within five miles of the source of supply; and (2) to clean and purify watercourses or drain and fill ponds on private property when they are offensive to the senses or dangerous to health. Third class cities are given jurisdiction over all sources of municipal water, both within and without the city limits, for the purpose of purification and pollution control, which may be effected by criminal ordinance. Second and third class cities are authorized to operate sewers, widen and improve waterways, and erect bridges. (Madsen-Florida)

STUDY RELATING TO ENVIRONMENTAL POLLUTION.
Public Law No 91-515, sec 501, 84 Stat 1297, 13 US Code Cong and Admin News p 5350-5351 (1970). 2 p.

Descriptors: *Public health, *Air pollution effects, *Water pollution effects, *Pollution abatement, Pollutants, Air pollution, Water pollution, Water pollution control, Water pollution sources, Water pollution treatment, Federal government, Legislation, Legal aspects, Environment, Air environment, Safety, Environmental sanitation, Data collections.

The President shall initiate a study of the following: (1) the nature and gravity of the hazards to human health and safety created by air, water and other common environmental pollution; (2) medical and other assistance available to persons affected by such pollution, especially when such pollution reaches emergency levels; and (3) the measures, other than those relating solely to the abatement of pollution, that may be taken to avoid or reduce the effects of such pollution on the health of individuals. The President shall submit this report to Congress within nine months of the enactment of this Act. This report shall include the following: (1) his conclusions regarding the gravity of the hazards to human health, (2) his evaluation of the available medical assistance when pollution reaches emergency levels, (3) his assessment of the measures that may be taken to avoid or reduce the effect of pollution on health, and (4) legislative or other recommendations. This report shall be updated annually. (Robinson-Florida)

FINANCIAL RESPONSIBILITY FOR OIL POLLUTION CLEANUP.
Federal Maritime Commission, Washington, D.C.

Federal Register, Vol 35, No 190, p 15216-15221 (Sept 1970). 6 p.

Descriptors: *Oily water, *Damages, *Water pollution control, *Water quality control, Oil, Oil wastes, Legislation, Federal government, Administration, Administrative decisions, Administrative agencies, Legal aspects, Regulation, Pollution abatement, Water policy, Water pollution, Water pollution sources, Water quality, Navigable waters, Financing.
Identifiers: *Water Quality Improvement Act.

Pursuant to the Water Quality Improvement Act of 1970 the Chairman of the Federal Maritime Commission herein proposes regulations concerning financial responsibility for oil pollution cleanup. The regulations define many terms used by the Act. Public vessels shall include vessels owned or bareboat chartered by a state. All vessels whether oil free or not are encompassed by these regulations. Owners or operators may file applications and establish evidence of financial responsibility. Corporate officers, personal owners, operators, and partners need not submit evidence of their authority to sign the application. An owner or operator may establish financial responsibility by insurance, surety bonds, guarantees, or self insurance. Deductible provisions in insurance policies are acceptible if the applicant evidences supplemental coverage for the deductible amount. Each vessel will be covered by a separate certificate of financial responsibility. No vessel over 300 gross tons shall use any port or navigable waters of the United States unless a certificate of financial responsibility has been issued covering such vessel. The procedures and methods of establishing financial responsibility are detailed in these regulations. Grounds for denial, revocation, or suspension of a certificate are also specified. ENVIRONMENTAL STATEMENT ON THE PROPOSED ELECTRIC POWER ENVIRONMENTAL POLICY ACT.

Federal Register, Vol 35, No 205, p 16440-16448 (Oct 1970). 9 p.

Descriptors: *Electric power demand, *Environmental effects, *Administrative agencies, *Powerplants, Administrative decisions, Regulation, Federal government, State governments, Legal aspects, Legislation, Planning, Engineering structures, Nuclear powerplants, Electric powerplants, Thermal powerplants, Hydroelectric plants, Electrical engineering, Environment, Environmental engineering, Water pollution, Water utilization, Water supply, Electric power.

Pursuant to the requirements of the National Environmental Policy Act the Federal Power Commission submits for comment a statement evaluating the environmental impact of the proposed Electric Power Environmental Policy Act, which is designed to ensure adequate electrical power supplies for the nation by facilitating the timely construction of generating facilities. The basic objective of the proposed act is the achievement of harmony between adequate power supplies and environmental protection. Public and private electric entities will have to acquire certification of powerplants and lines well in advance of construction. State or regional certification of sites and facilities will be required except for those facilities owned or operated by the federal government. If state agencies fail to take action the Federal Power Commission will exercise the certification responsibility. Certification will be granted when it appears that there is a valid need for power and that neither public health and safety nor ecological systems will be irreparably harmed. The Federal Power Commission will be authorized to delegate to the Atomic Energy Commission the certification of nuclear facilities. (Robinson-Florida)
W71-09589

UNITED STATES V VULCAN MATERIALS CO (POLLUTION PROSECUTION UNDER THE NEW YORK HARBOR ACT).
320 F Supp 1378-1381 (D NJ 1970).

Descriptors: *New Jersey, *Pollution abatement, *Water pollution control, *Water quality control, Federal government, Legislation, Judicial decisions, Legal aspects, Pollutants, Water policy, Water pollution, Water quality, Harbors, Industrial wastes, Oil wastes, Acids, Alkalis (Bases), New York.

The United States prosecuted defendant manufacturers for discharging acid, alkaline, and oil waste

into New York Harbor in violation of the New York Harbor Act. The substances discharged by defendant were liquid and entered the water by a sewer line. Defendant contended that the discharge was permitted by the statute, since the statute only applied to discharges which would be navigational obstructions. Defendant argued that the Federal Water Pollution Control Act impliedly repealed the New York Harbor Act. Other contentions of defendant were: (1) it was unfair to prosecute defendant when New Jersey had instituted civil proceedings against them, (2) defendant had expended 'millions' to correct the problem, and (3) defendant was taking appropriate steps to remedy the situation. Defendant's motion to dismiss was denied by the federal district court. Discharge of acids, alkalines, and oil is in violation of the statute, since the statute contemplates organic matter which will decompose. The Federal Water Pollution Control Act does not repeal the New York Harbor Act. A defendant's expenditures and efforts do not exempt him from criminal prosecution, nor does the fact that civil proceedings have been instituted against him. (Robinson-Florida)
W71-09660

ESTABLISHING THE ENVIRONMENTAL QUALITY COUNCIL AND THE CITIZENS ADVISORY COMMITTEE ON ENVIRONMENTAL QUALITY,
Richard M. Nixon.
Exec Order No 11472, Code of Federal Regulations, Title 3, Chap II, p 122-125 (1969 Compilation). 4 p.

Descriptors: *Environment, *Administrative agencies, *Environmental effects, *Federal project policy, Federal government, State governments, Local governments, Administration, Water pollution, Water pollution control, Water pollution sources, Pollutants, Pollution abatement, Regulation.

The Environmental Quality Council, consisting of the President, Vice-President, and the Secretaries of Agriculture, Commerce, HEW, HUD, Interior, and Transportation, is formed to advise and assist the President on environmental quality matters, including: (1) recommendation of measures to ensure that federal policies and projects take adequate account of environmental effects; (2) review of the adequacy of existing systems for monitoring and predicting environmental changes; (3) encouragement of federal, state, and local cooperation; (4) stimulation of public and private participation in programs to prevent and abate pollution; (5) encouragement of technological development to prevent adverse environmental effects; (6) encouragement of timely disclosure of plans affecting environmental quality; (7) assessment of new technologies for their potential environmental effects; and (8) facilitation of coordination among federal administrative agencies in protecting the environment. Additionally, the Council shall review plans of federal agencies affecting outdoor recreation and natural beauty. The Citizens' Advisory Committee on Environmental Quality has 14 members, who shall advise the President and the Council on the duties assigned to the Council. (Hart-Florida)

INTERSTATE SANITATION COMMISSION--POWERS.

Public Act No 7, Connecticut Legislative Service, p 6-7 (1969). 2 p.

Descriptors: *Connecticut, *Interstate compacts, *Interstate commissions, *Water quality control, Tidal waters, Legislation, Water policy, Water pollution control, Water pollution, Water purification, Water quality, Pollution abatement, Pollutants, Waste disposal, Waste water (Pollution), Biochemical oxygen demand, Effluents, Solid wastes, Liquid wastes.

The signatory states of the Interstate Sanitation Commission agree that no sewage or pollutants shall be allowed in the tidal waters of the district unless the following conditions and restrictions are met. All sewage discharged into class 'A' waters shall be treated as follows: (1) all floating solids and 60% of suspended solids shall have been removed, (2) intestinal bacilli shall be reduced to not more than one per cubic centimeter in more than 50% of sewage effluents tested, and (3) average dissolved oxygen of not less than 50% saturation shall be maintained. Sewage discharged into class 'B' waters must have all floating solids and 10% of suspended solids removed, and the average dissolved oxygen content must be not less than 30% saturation. Other classifications of waters and effluent standards may be developed, after public hearing, in addition to or in substitution of those set forth in this Article or Article VI of the compact. Any such additional or substitute classifications and standards shall take effect when the states of New Jersey and New York have similarly amended the tri-state compact. (Robinson-Florida)
W71-09688

USE OF CHEMICALS, MATERIALS OR TECHNIQUES TO TREAT OIL SPILLS (MASSACHUSETTS POLICY STATEMENT).
Massachusetts Div. of Water Pollution Control, Boston.

Commonwealth of Massachusetts, Division of Water Pollution Control, Publication No 5394, nd. 7 p, 1 append.

Descriptors: *Massachusetts, *Chemcontrol, *Oily water, *Administrative agencies, Water pollution sources, Water pollution treatment, Commercial shellfish, Freshwater fish, Saline water fish, Fishkill, Pollution abatement, Abatement, Water pollution.

The Massachusetts Department of Water Pollution Control has established a policy with regard to the chemical treatment of oil spills. While physical and mechanical means are expressly favored, floating non-toxic insoluble chemical absorbents may be used without restriction. Use of chemical dispersants is discouraged; they may only be used under restricted conditions and with the prior approval of the Department. The restrictions are consistent with those contained in the National Oil and Hazardous Materials Pollution Contingency Plan. The use of chemical sinking agents is prohibited. Telephone numbers are listed for the reporting of oil spills. An appendix contains an analysis of the tolerance of fresh and salt water fish to particular commercial brands of dispersant chemicals. (Kohla-Florida)

GOVERNMENTAL RESPONSIBILITIES FOR WATER DEVELOPMENT,
Oregon State Univ., Corvallis.
James H. Jensen.
Proceedings of the Western Interstate Water Conference, Strategies for Western Regional Water Development, Corvallis, Oregon, 1965, p 116-124. 2 ref.

Descriptors: *Water resources development, *Project planning, *Economic feasibility, State governments.
Identifiers: *Oregon State University, Willamette Basin Study, Puget Sound Study, Columbia Basin Survey.

This article describes the role that states can and should play in planning water resource development. By citing several examples of studies carried out at Oregon State University the author illustrates the constructive role of states. Instead of commenting on a study completed by a federal agency, a state can make a more positive contribution by conducting a study of its own. (Holmes-Rutgers)
W71-09696

STATE CERTIFICATION OF ACTIVITIES REQUIRING FEDERAL LICENSE OR PERMIT.

Federal Register, Vol 36, No 25, p 2516-2518 (Feb 1971). 3 p.

Descriptors: *Administrative agencies, *Permits, *Water pollution control, *Navigable waters, Pollution abatement, Water pollution, Water pollution sources, Administration, Regulation, Discharge (Water), Sediment discharge, State governments, Interstate commissions.
Identifiers: *Water Pollution Control Act.

The Federal Water Pollution Control Act requires applicants for a federal license to conduct activity which may result in discharges into navigable waters of the United States to obtain certification that such activity will not violate applicable water quality standards. Proposed rules to regulate certification are in four parts. Part A provides definitions of general applicability for the regulations and rules governing uniform content and form of certification. Part B establishes procedures for determination by the Administrator as to whether a discharge may affect the quality of waters of a state other than the state where the discharge originates. Part C establishes procedures for certification by the Administrator where standards have been promulgated by him, and where no state or interstate agency has authority to certify that there is reasonable assurance that the activity resulting in discharges will be conducted in a manner not violating water quality standards. Part D provides for consultation between the Administrator and federal licensing and permit-issuing agencies with respect to the meaning, content, and application of

water quality standards and related matters. (Hart-Florida)
W71-09698

CERTIFICATION OF FACILITIES FOR WATER POLLUTION CONTROL.

Code of Federal Regulations, Title 18, Chap V, part 602 (1970). 3 p.

Descriptors: *Water pollution control, *Treatment facilities, *Administrative agencies, *Taxes, State governments, Local governments, Administrative decisions, Regulation, Water treatment, Waste treatment.

Under section 48 of the Internal Revenue Code, the Secretary of the Interior certifies facilities for purposes of the section 38 depreciation deduction. Regulations governing certification are contained in this publication. After defining various terms, general provisions for filing and routing of applications are set forth. If the certification is refused, the applicant must be informed of the reasons for refusal. Next, the information required in the application is delineated. No application will be approved by the Secretary unless it is accompanied by a state certification that the facility conforms to state requirements for water pollution control. The general policies of the United States for cooperation with the states in prevention and abatement of water pollution are also promulgated. A facility will be certified if the Secretary determines that it complies with these regulations, regulations of other agencies, and the general policies. Five factors are to be considered by the Secretary in his determination: (1) water quality standards and implementation plan; (2) recommendations issued pursuant to the Federal Water Pollution Control Act; (3) state pollution control programs; (4) comprehensive pollution controls under section 3 of the Water Pollution Control Act; and (5) local standards for water pollution control. (Hart-Florida)

NOTICE OF A MEMORANDUM OF UNDERSTANDING PROVIDING FOR COOPERATION IN THE INVESTIGATION OF VIOLATIONS OF THE REFUSE ACT.
Department of the Army, Washington, D.C.

Federal Register, Vol 36, No 32, p 3074-3075 (Feb 1971). 2 p.

Descriptors: *Water pollution control, *Administrative decisions, *Water quality control, *Pollution abatement, Federal government, Federal jurisdiction, Regulation, Administration, Administrative agencies, Legal aspects, Water policy, Water pollution, Water quality, Interstate rivers, Navigable waters, Pollutants, Permits.
Identifiers: *Refuse Act.

Pursuant to the Refuse Act and the Federal Water Pollution Control Act a memorandum of understanding between the Department of the Army and the Environmental Protection Agency (EPA) is promulgated to provide for cooperation in the investigation of violations of the Refuse Act. The Department of the Army has primary responsibility for enforcement of the Refuse Act, and the EPA has primary responsibility for the control of pollution of interstate and navigable waters. Persons desiring to deposit refuse in navigable waters will be required to obtain a permit from the Department of the Army. One who discharges wastes into such waters without a permit may be subjected to legal proceedings. When a District Engineer believes that a discharge has occurred having an adverse effect on water quality he shall notify the Regional Representative of the EPA. If the Regional Representative believes that there has been an adverse effect on water quality he shall submit a report to the District Engineer. If a refuse permit is suspended the District Engineer shall notify the Regional Representative. If legal action is deemed necessary the appropriate United States attorney should be notified. (Robinson-Florida)

CONTROL OF POLLUTION BY OIL AND HAZARDOUS SUBSTANCES, DISCHARGE REMOVAL.
Coast Guard, Washington, D.C.

Federal Register, Vol 36, No 71, p 7009-7011 (Apr 1971). 3 p.

Descriptors: *Water pollution control, *Administrative agencies, *Oil wastes, *Government finance, Federal government, Legal aspects, Regulation, Administration, Administrative decisions, Water pollution, Water pollution treatment, Oil, Oily water, Water pollution sources, Water policy, Pollution abatement, Financing, Legislation.
Identifiers: *Water Pollution Control Act, *Water Quality Improvement Act.

Pursuant to the Federal Water Pollution Control Act, as amended by the Water Quality Improvement Act of 1970, the Commandant of the Coast Guard promulgates regulations dealing with control of pollution by oil and other hazardous substances. The Act provides for the establishment of a fund which may be used to pay the following: (1) costs for phase II and III actions under the National Contingency Plan; (2) judgments, compromises, and settlements; and (3) any other costs deemed proper by the Commandant. However, the fund may not be used to pay the costs of removing oil discharged from United States public vessels or facilities. Requests for payment must be made in accordance with the Regional Contingency Plan. Claims asserted shall be in accordance with the Federal Claims Collection Act of 1966. The Commandant shall deposit in the fund monies received by the United States from: (1) payment of fines under the Act, (2) payment of civil penalties under the Act, (3) payments as a result of demand for payment or in compromise or settlement of an action brought under section 11 (f) and (g) of the Act, and (4) payments in satisfaction of judgments obtained under the Act. (Robinson-Florida)
W71-09701

A BILL TO CONSENT TO THE INTERSTATE ENVIRONMENT COMPACT.

Senate Bill 907, 92d Cong., 1st Sess (1971). 10 p.

Descriptors: *Interstate compacts, *Environmental sanitation, *Water pollution control, *Pollution abatement, Legal aspects, Legislation, Federal government, State governments, Environment, Water pollution, Wastes, Waste disposal, Waste treatment, Water pollution treatment, Water policy, Water quality, Water quality control, Water treatment.

Because environmental pollution problems transcend state boundaries this bill would provide congressional consent for any two or more states to enter into the Interstate Environment Compact. Nothing in the Compact would impair or extend the Constitutional authority of any signatory state or the United States. Signatories would be authorized to participate with the federal government in interstate environmental protection. Other existing governmental arrangements not primarily directed to environmental protection would not be affected. Supplementary agreements may be made by the signatories. Nothing herein would diminish or supersede existing interstate compacts. This compact would not affect future multistate compacts not in conflict. Signatories would be allowed to enter into special supplementary agreements with the District of Columbia or foreign nations for the same purposes as those of the compact if the non-signatories accept the general obligations of the Compact. This Compact does not affect the authority of signatories to enact environmental legislation not inconsistent with it. The provisions of the Compact would be severable. States would be allowed to withdraw one year after written notice to the other signatories. Amendments would be effective when approved by all signatories and Congress. (Robinson-Florida)
W71-09702

GREAT LAKES BASIN CONSERVATION ACT (A BILL TO AMEND THE SOIL CONSERVATION AND DOMESTIC ALLOTMENT ACT TO PROVIDE FOR A GREAT LAKES BASIN CONSERVATION PROGRAM).
Senate Bill 1156, 92d Cong, 1st Sess (1971). 6 p.

Descriptors: *Soil conservation, *Water conservation, *Contracts, *Adoption of practices, Federal government, Economics, Erosion control, Land management, Land resources, Project purposes, Water resources development, Pollution abatement, Agricultural engineering, Farm management, Administrative agencies, Land use, Erosion, Government finance.

Under this proposed amendment to the Soil Conservation and Domestic Allotment Act, entitled the Great Lakes Basin Conservation Act, the Secretary of Agriculture is authorized to contract with landowners to share the cost of alterations in cropping systems and land use in order to conserve soil and water resources. The landowner furnishes the plan of farming operations, which should incorporate maximum practicable soil and water conservation principles, and outlines the schedule of proposed changes. The plan shall include measures for fish and wildlife conservation, promoting economic land use, and reducing agricultural pollution, to the extent practicable. Under the contract, the landowner must agree: (1) to effectuate the plan; (2) to forfeit further payments for breach; (3) to forfeit further payments upon alienation, unless the new owner assumes the contract obligations; (4) not to adopt practices contravening the plan; and (5) to accept additional provisions desired by the Secretary. By mutual agreement, the contract may be terminated. In addition, state and local conservation programs are to be considered in making the contract. (Hart-Florida)
W71-09703

DEEP OCEAN DUMPING OF BALED REFUSE.
US Government Printing Office, Washington, DC, National Industrial Pollution Control Council, Sub-Council Report (Feb 1971). 15 p.

Descriptors: *Cities, *Oceans, *Waste disposal, *Environmental effects, Degradation (Decomposition), Municipal wastes, Sanitary engineering, Sludge disposal, Federal government, Research and development, Wastes.

No comprehensive studies on the effect of refuse dumping on the ocean environment have been completed. Although a recent report points out the danger of continued uncontrolled dumping, it does not recommend development of systems for safe exploitation of the enormous absorptive capacity of the oceans. Furthermore, no long-term tests have been conducted on the behavior of municipal solid waste on the ocean floor which measure chemical or biological degradation rates or the effects of such wastes on the environment. The known serious offenders of ocean pollution are sewage sludge, industrial chemical waste, and oil spillage. Municipal refuse does not contain nutrients characteristic of sewage or toxic elements characteristic of industrial chemical wastes. Moreover, municipal refuse may be compressed into bales for depositing into deep ocean sites where biological activity is minimal. However, baled refuse might float initially or interfere with biological systems in the ocean. The United States should begin a series of experiments to develop acceptable methods for disposal of municipal refuse in the oceans to alleviate pressing municipal refuse problems. (Hart-Florida)
W71-09704

STATE CERTIFICATION OF ACTIVITIES REQUIRING A FEDERAL LICENSE OR PERMIT.
Environmental Protection Agency, Washington, D.C.

Federal Register, Vol 36, No 90, p 8563-8565 (May 1971). 3 p.

Descriptors: *United States, *Water pollution control, *Standards, *Permits, Legal aspects, Regulation, Administrative agencies, Federal government, Water rights, Administration, Inspection, Water resources development, Water pollution effects, State governments, Environmental effects, Water conservation, Water quality control, Water resources, Pollution abatement, Water pollution sources, Water law.

Any applicant for a federal permit to conduct an activity that might result in any discharge into the navigable waters of the United States is required to obtain certification from the appropriate agency that the activity will not violate applicable water quality standards. The Regional Administrator of the Environmental Protection Agency shall review applications for permits and certifications to determine if discharges might affect the water quality of another state. If he determines that there would be such an effect, he shall notify the other state, which may object to the granting of the permit. The Administrator shall give certification when: (1) he has promulgated the applicable standards, or (2) the state has not delegated authority to give such a certification even though it has set up its own standards. Certification by the Regional Administrator shall be given only after proper notice and hearing. A Regional Administrator shall be allowed to inspect facilities certified in connection with issuance of a permit for construction. Any violation of the standards appearing at this inspection may be brought before the issuing agency to decide if the permit should be suspended. (Johnson-Florida)
W71-09705

CLEAN WATERS FOR AMERICA WEEK, 1971,
Richard M. Nixon.
Proclamation 4049, Federal Register, Vol 36, No 86, p 8289-8290 (May 1971). 2 p.

Descriptors: *United States, *Water pollution, *Water policy, *Water resources development, Legal aspects, Federal government, Social aspects, Environmental effects, Natural resources, Water resources, Water utilization, Water quality, Water treatment, Water pollution treatment, Pollution abatement, Water quality control, Water shortage, Water requirements.

One of America's greatest challenges in the 1970s will be ending the wasteful and destructive practices which have so seriously degraded our environment. Americans have taken our natural resources for granted, confident that our land would provide enough good water for every need. The truth is that we have uncovered no new sources of fresh water for many years. At the same time, population growth and technological advances have tremendously increased both the overall and the per capita consumption of water, while inadequate treatment of wastes has contaminated more and more of our water resources. Quick and effective action is required to protect our waters from further deterioration and to treat wastes so that water may be used again. President Nixon designates the week beginning May 2, 1971, as Clean Waters for America Week. All Americans are urged to observe this week with appropriate ceremonies, activities, and educational programs. We are also encouraged to support governmental efforts to clean up our national waterways and to adopt new habits and practices which will contribute to the enhancement of water quality in this country. (Johnson-Florida)

BASS ANGLER SPORTSMAN SOC'Y V UNITED STATES STEEL CORP (PRIVATE PARTY LACKS RIGHT TO ENFORCE ANTI-POLLUTION PROVISIONS OF RIVERS AND HARBORS ACT).
324 F Supp 412-417 (D Ala 1971).

Descriptors: *Alabama, *Rivers and Harbors Act, Pollution abatement, *Water pollution control, Water pollution, Water quality control, Navigable waters, Navigable rivers, Judicial decisions, Water law, Legal aspects, Remedies.

Plaintiff society sued various corporate and government defendants, seeking the imposition of fines for violation of the Rivers and Harbors Act of 1899 and to enjoin further violations. The Act proscribes dumping of refuse matter into navigable waterways and provides for imprisonment and fine, one half of which may be paid to the person giving information leading to conviction. Plaintiff contended that this latter provision entitled it to maintain an action to enforce the Act. On consolidated hearing, the United States District Courts for the Northern, Middle, and Southern Districts of Alabama granted defendants' motions to dismiss. The courts held that a private party had no right to enforce a criminal fine by civil action, and that injunction is not the proper remedy for enforcement of the criminal law. (Madsen-Florida)

ENVIRONMENTAL DEFENSE FUND INC V CORPS OF ENGINEERS (INJUNCTION HALTING CONSTRUCTION OF BARGE CANAL).
324 F Supp 878-883 (DDC 1971).

Descriptors: *Florida, *Canal construction, *Environmental effects, *Ecosystems, Balance of nature, Water pollution, Wildlife conservation, Water conservation, Aesthetics, Scenery, Water pollution effects, Ecology, Rivers, Natural resources, Water resources development, Recreation, Hunting, Fishing, United States, Federal government, Organizations, Administrative agencies, Legislation, Adjudication procedure, Legal aspects, Judicial decisions.
Identifiers: *Cross-Florida Barge Canal.

Plaintiff conservationist organizations sought preliminary injunctive relief against the Army Corps of Engineers to prevent further construction on the Cross-Florida Barge Canal. Plaintiffs contended that the Canal was being built in violation of statutes designed to preserve natural resources, and that unless the relief was granted, irreparable damage would result to the Oklawaha River ecosystem, including destruction of wildlife and water pollution. Defendant contended that plaintiffs lacked standing to sue, that the government was immune through the doctrine of sovereign immunity, and that the statutes did not apply to the Canal. The United States District Court, in granting the preliminary injunction, noted that public conservationist groups have a sufficient interest in environmental values to have standing to sue as representatives of the public interests involved. The doctrine of sovereign immunity was inapplicable because plaintiffs alleged that the government was acting beyond its statutory authority and that the exercise of authority was constitutionally void. Plaintiffs sufficiently alleged violations of various statutes designed to protect the environment. Further work on the Canal was temporarily halted to prevent irreparable harm to the environment. (Smiljanich-Florida)
W71-09708

TOWARD A CONSTITUTIONALLY PROTECTED ENVIRONMENT.

Virginia Law Review, Vol 56, p 458-486 (1970). 29 p, 124 ref.

Descriptors: *Legal aspects, *Judicial decisions, *Environment, *Public rights, Legislation, Adjudication procedure, Rivers and Harbors Act, Water Quality Act, Federal government, State governments, Public health.
Identifiers: *Constitutionality.

The recent public awareness of environmental degradation has generated a search for a constitutional means of protecting the environment. Although no express constitutional provision protects the environment, the Supreme Court in Griswold v. Connecticut found a constitutional right to privacy in the penumbra of the Bill of Rights, or as part of the due process clause. Constitutional protection of the environment might be found as in Griswold, through interpretation of the Ninth Amendment. Also, environmental rights could be recognized as another facet of the developing 'right to be let alone', expanding the scope of individual constitutional protection to include integrity of natural surroundings. The public's environmental rights have also been protected through court construction of federal legislation. Although a constitutional right to an environment cannot be explicitly defined, the public should be protected from 'unreasonable' environmental degradation. Three obstacles exist to asserting the right of environmental protection: (1) state action within 42 U.S.C. 1983; (2) lack of justiciability of the controversy; and (3) difficulty in framing an adequate decree. Judicial recognition of constitutional environmental rights is necessary for effective environmental protection. (Hart-Florida)

THE 'FINAL' WATER WELL LAW AND REGULATIONS,
National Water Well Association, Urbana, Ill. Manufactures Div.
D. Fumes.
Water Well Journal, Vol 20, No 1, p 57-68, January 1966, 1 tab.

Descriptors: *Legislation, *Well regulations, *Water wells.
Identifiers: *Water well construction standards, Pump installation standards, Water well construction and pump installation act, Abandoned wells, Grouting, Disinfection.

The water well industry, in general, is under increasing pressure. It has been told that individual wells are 'unsafe' offer a health hazard.....are not regulated and supervised like central water supplies. The author admits that to some extent the accusations are true. Few states have effective licensing laws to keep practices at a high level. Even fewer states have effective control over how wells are constructed or how pumps are installed. It is to put an end to such charges that the water well law was developed. It is designed to protect public health. The sponsors feel that it will up-grade our industry by forcing contractors to meet higher standards than are sometimes the case and by forcing all contractors to do an adequate job. The law should benefit both the public and the well contractor. The law was developed by the Industry Committee for Private Water Resource Protection and was sponsored by the American Institute, Central Supply Association, National Water Well Association and the Water Systems Council. The laws represents a consensus reached by over 100 drilling contractors, pump installers throughout the country and has been endorsed by the Public Health Service, the Conference of State Sanitary Engineers and the American Public Health Association. WYOMING WATER AND THE MINERAL INDUSTRY, THE LAW, THE PROBLEMS, AND SOURCES OF INFORMATION,
Wyoming State Engineer's Office, Cheyenne.
S. H. Ross.
22nd Annual Field Conference - September 21-23, 1970, Casper, Wyoming: Wyoming Geological Association Guide Book, 292 p.

Descriptors: *Wyoming, *Legislation, Groundwater, Drilling, *Water wells, Waste disposal.
Identifiers: *Mining industry, Water rights, Pollution, Solution mining potential pollution.

Because of an ever-increasing interest in Wyoming's water resources, especially groundwater resources, this paper has been written to acquaint water users (and potential water abusers)

with this vital resource. Emphasis is on (1) the history of water usage and water legislation; (2) water laws as they apply to industry, especially the extractive mineral industry, today; (3) problems caused by continued exploitation of both groundwater and mineral resources that lie within and below usable groundwater deposits; and (4) sources of information on groundwater in Wyoming. This paper is especially well written and well referenced. (Campbell-NWWA)

THE VALUE OF STATE GROUNDWATER AGENCIES TO THE SMALL WATER WELL CONTRACTOR,
Ohio Div. of Water, Columbus.
A. C. Walker.
Groundwater, Vol 1, No 1, p 4-7, January 1963, 12 fig.

Descriptors: *Water wells, Groundwater, Drilling.
Identifiers: *State groundwater agencies, *Water well contractor, Cooperation, Pollution control well logs, Information exchange.

It is the State's responsibility to see that its groundwater resources are developed with as little 'red tape' as possible. The well driller's responsibility is to his customers. Both State groundwater agencies and water well drillers can carry out their responsibilities best by working together. Such cooperation can eliminate unnecessary drilling regulations and result in better wells through exchange of information. In many instances, overdevelopment or contamination of an aquifer could have been avoided if drillers and States had worked together, rather than in opposite directions. (Campbell-NWWA)

REGULATIONS PERTAINING TO ISSUANCE OF A PERMIT.
Missouri Water Pollution Board.

Missouri Water Pollution Board, Jefferson City, 65101 (1967). 5 p.

Descriptors: *Missouri, *Permits, *Administrative agencies, *Regulation, Control, Water pollution control, Inspection, Testing, Industrial wastes, Sewage treatment, Water treatment, Administration, Pollution abatement, Water pollution treatment, Water quality control, On-site investigation, Sewage disposal, Treatment facilities, Waste water treatment, Waste treatment, Water policy.

The Water Pollution Board is empowered to issue permits to all persons operating any system for the collection, treatment, or disposal of sewage, industrial waste or other waste into the waters of the state. Permits shall specify the conditions at the time of issuance and shall be designed to carry out the purposes of the State Water Pollution Act. No person shall erect, modify, commence, or operate any such system without first securing the appropriate construction or operating permit from the Board. Construction permits are granted only after the Board has examined and approved both the preliminary engineering report and the final plans for operation. Operating permits are granted after examination by the Board to determine that the completed work adheres to the approved plans. All plants shall be inspected periodically by representatives of the Board. (Horwitz-Florida)

NAVIGABLE WATERS POLLUTION CONTROL ACT OF 1965 (A BILL TO PROVIDE FOR THE ESTABLISHMENT OF REGULATIONS FOR THE PURPOSE OF CONTROLLING POLLUTION FROM VESSELS AND OTHER SOURCES IN THE NAVIGABLE WATERS OF THE UNITED STATES).

Senate Bill 1908, 89th Cong, 1st Sess (1965). 12 p.

Descriptors: *Navigable waters, *Water pollution control, *Ships, *Regulation, Administrative agencies, Water pollution, Water quality, Water quality control, Legislation, Oil, Legal aspects, Oily water, Waste disposal, Wastes, Pollution abatement, Abatement.
Identifiers: *Refuse Act of 1899, *Oil Pollution Act.

The Navigable Waters Pollution Control Act of 1965 proposed in this Senate bill endeavors to expand and improve existing law and provide authority to establish regulations controlling pollution in navigable waters of the United States. Various administrative agencies are authorized to establish regulations concerning equipment and facilities and treatment and disposal of oil, sewage, and refuse from vessels in navigable waters of the United States. The Coast Guard is responsible for implementing the regulations. A technical committee will be appointed to formulate the regulations. The 1924 Oil Pollution Act is amended by providing new definitions, making discharge of oil unlawful except during emergencies, and establishing liability for removal of all oil discharged. Penalties for violation are prescribed. The Coast Guard may suspend or revoke licenses for violation of the Act. The 1961 Oil Pollution Act is amended making violation of certain provisions a misdemeanor and establishing penalties. Enforcement of its provisions will also be by the Coast Guard. The Refuse Act of 1899 is amended to provide that the Coast Guard shall administer its provisions. (Hart-Florida)

A BILL TO AMEND THE INTERNAL REVENUE CODE OF 1954 TO ENCOURAGE THE ABATEMENT OF WATER AND AIR POLLUTION BY PERMITTING AMORTIZATION OF THE COST OF ABATEMENT WORKS.

Senate Bill 1670, 89th Cong, 1st Sess (1965). 8 p.

Descriptors: *Taxes, *Pollution abatement, *Water pollution control, *Amortization, Air pollution, Water pollution, Administrative agencies, State governments, Federal government, Legal aspects, Non-structural alternatives, Financing, Depreciation, Facilities.

Abatement of air and water pollution would be encouraged under this Bill, which adds section 183 to the internal Revenue Code of 1954, by permitting amortization of the cost of abatement works over a 36 month period. Any taxpayer may elect to amortize abatement works on the straight-line method not later than the time for filing in the year in which the Secretary of Health, Education, and Welfare (HEW) certifies the abatement works. Performance standards for abatement works will be established by HEW. When the state certifying authority has certified to HEW that state standards have been met, and HEW has certified to the Secretary that minimum HEW standards are satisfied, the works qualify for amortization. However, HEW may not certify works for the extent to which the profits from abatement works will be sufficient to recover its cost over its actual useful life. The basis of abatement works shall be allocated between certified and non-certified portions of the works. Other sections of the Code are modified as required. (Hart-Florida)
W71-09785

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT IN ORDER TO ESTABLISH A PROGRAM TO DECREASE WATER POLLUTION BY SYNTHETIC DETERGENTS.
Senate Bill 1479, 89th Cong, 1st Sess (1965). 5 p.

Descriptors: *Pollution abatement, *Water pollution control, *Detergents, *Degradation (Decomposition), Water pollution sources, Water quality, Water quality control, Soaps, Chemical wastes, Domestic wastes, Legislation, Administrative agencies, Pollutants, Administrative decisions, Administration, Federal government, Regulation.

A program to decrease water pollution caused by use of synthetic detergents which do not decompose or which decompose slowly would be established by this proposed amendment to the Federal Water Pollution Control Act. Efforts to develop fast-decomposing detergents are encouraged through liaison with detergent manufacturers. Standards of bio-degradability will be developed by the Secretary of Health, Education and Welfare, with the assistance of a technical committee composed of members from various sources. The decomposability standards will be developed from tests simulating municipal sewage treatment and household waste treatment. The Secretary is authorized to promulgate rules prohibiting sale or transport in interstate commerce of detergents failing to meet the decomposability standards. Furthermore, rules may be established which prohibit importation of detergents not meeting the standards. Violation of these rules is a misdemeanor, punishable by fine. (Hart-Florida)

YEAGER V CITY OF PITTSBURGH (NEGLIGENCE IN MAINTAINING OPEN SEWER).

103 Pa Sup Ct 34, 157 A 353-354 (1931).

Descriptors: *Pennsylvania, *Drainage systems, *Storm runoff, *Water injury, Costs, Judicial decisions, Legal aspects, Water law, Structures, Sewers, Open channels, Sewage disposal, Cities, Local governments, Surface runoff, Floods, Rainfall, Water control, Flood control, Overflow, Environmental effects, Storms, Flood damage, Damages.

Plaintiff owned property which was bounded by Beck's Run. Defendant city maintained the run as an open sewer to carry off both storm or surface water and sanitary sewage. The average depth some years before this action had been six feet and had been sufficient to carry off all the water discharged into it. Plaintiff's house, cellar, and garden were flooded after a severe storm. Plaintiff brought suit, alleging that defendant had negligently maintained its sewer, permitting the bed of the run to become filled up with sand and debris so that the normal depth of the run was reduced to two feet or less. The trial resulted in a jury verdict for plaintiff and the Superior Court of Pennsylvania found that there was sufficient evidence to support the verdict. The court stated that when a city uses a stream or water course as an open sewer, it assumes the duty of keeping it clear of obstructions. If, after adequate notice, it permits the channel to become obstructed, with resulting

damage to neighboring property, it must respond in damages for the tort. (Johnson-Florida)

GUNDY V VILLAGE OF MERRILL (CITY'S RESPONSIBILITY FOR NUISANCE CREATED BY OPEN DRAINAGE OF SEWAGE).
250 Mich 416, 230 NW 163-164 (1930).

Descriptors: *Michigan, *Sewage disposal, *Drainage systems, *Waste water (Pollution), Judicial decisions, Legal aspects, Municipal wastes, Cities, Waste disposal, Sewage, Wastes, Sewerage, Sewers, Drainage, Drainage practices, Damages, Remedies, Waste water disposal.

Plaintiff landowners sued defendant city and defendant creamery company seeking damages and an injunction. An outlet of the village sewer emptied into an open drain which crossed plaintiff's land. The creamery company also deposited wastes therein. Defendants claimed that the drain was a county drain and that the city had no duty or jurisdiction over it. Defendants further argued that plaintiff had lost his right to complain by prescription, and that plaintiff had contributed to the problem by allowing weeds to grow in the drain. The trial court granted no damages but ordered the nuisance abated within 60 days. The Supreme Court of Michigan modified the judgment by allowing the defendants an extension of time in which to abate the nuisance. A municipality has no right to deposit sewage into an open drain if it will cause a nuisance, nor can prescriptive rights to maintain a public nuisance be acquired. (Robinson-Florida)

SHELBY LOAN AND TRUST CO V WHITE STAR REFINING CO (LIABILITY FOR POLLUTION OF LAKE).
271 Ill App 266-269 (1933).

Descriptors: *Illinois, *Lakes, *Oil industry, *Water pollution, Water pollution sources, Water pollution effects, Water pollution control, Pollutants, Pollution abatement, Oil, Water quality, Water quality control, Legal aspects, Judicial decisions.

Plaintiff riparian landowner sought to enjoin defendant petroleum refining company from polluting a lake on plaintiff's property. Defendant discharged various chemicals and petroleum refuse into surface water which flowed naturally into plaintiff's lake. Defendant contended, however, that it maintained a purifying system, and that therefore the pollution of plaintiff's lake did not result from its discharges. Defendant also asserted that two other companies caused pollution of plaintiff's lake. The Illinois Appellate Court determined that defendant caused at least part of the pollution and stated that defendant would not be relieved of liability because others contributed. A defense of laches was also rejected. Defendant also contended that a permanent injunction would confer no substantial benefit upon plaintiff, while seriously injuring defendant. Nevertheless, the court affirmed the injunction issued by the trial court. (Hart-Florida)

DELAWARE RIVER BASIN COMMISSION RULES OF PRACTICE AND PROCEDURE AND BASIN REGULATIONS--WATER QUALITY.
Code of Federal Regulations, Title 18, Chap III, parts 401 and 410 (1970). 12 p.

Descriptors: *Delaware River Basin Commission, *Regulation, *Delaware River, *Water quality, Administrative agencies, Administrative decisions, Adoption of practices, Water resources, Water resources development, Interstate rivers, River basins, Administration.

The rules of practice and procedure of the Delaware River Basin Commission are in six subparts; subpart A contains rules governing the submission, consideration, and inclusion of projects in the comprehensive plan for the development of river basin resources. Subpart B describes procedures governing the submission, consideration, and inclusion of projects into the water resources program. Subpart C prescribes rules providing for commission approval before inclusion in the comprehensive plan of any project having a substantial effect on basin water resources. Subpart D provides rules of practice and procedure for review in water quality cases. Provisions for conduct of hearings are delineated in subpart E, including provisions governing staff and expert testimony, record of proceedings, and findings and reports. Subpart F contains general provisions for definitions of words used in the Compact, waiver of rules, and construction of the Compact. The second portion of the regulations, entitled 'Basin Regulations-Water Quality', incorporates by reference provisions previously adopted by the Commission for establishment and enforcement of water quality standards. FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
William R. Waker.
Available from the National Technical Information Service as PB-200 657, $3.00 in paper copy, $0.95 in microfiche. Virginia Water Research Center Bulletin 10, Apr 1971. 293 p, 19 fig, 38 tab, 8 append. OWRR Project A-006-VA (1).

Descriptors: *Floods, *Flood damage, *Virginia, *Flood plain zoning, *Legislation, Non-structural alternatives, Cost-benefit analysis, Water resources development, Urbanization, Flood protection, Channel improvement, River training, Regulation, Flood plain insurance, Flood control, Land use, Zoning.
Identifiers: *Flood damage abatement.

This study gives a quick review of the national flood problem, a comprehensive review of the problem in Virginia, an identification of various programs which have attempted to meliorate flood damages, and two major pieces of legislation recommended to be adopted for further progress in flood damage abatement. Floods are too big a problem to be handled piecemeal. Only when we shift from simply reacting to them to actually planning for them can we expect to make headway in reducing flood damage losses. 6G. Ecologic Impact of Water Development

THE OAKLEY PROJECT--A CONTROVERSY IN LAND USE,
Illinois State Water Survey, Urbana.
William C. Ackermann.
Environmental Geology Notes, Illinois State Geological Survey, No 46, p 33-39, May 1971.

Descriptors: *Land use, *Conservation, *Social respects, *Flood control, Water resources development, Water supply.
Identifiers: *Metropolitan water problems, *Flood plain management, Environmental quality, Oakley Dam, Allerton Park, Decatur, Illinois Division of Waterways.

Plans are discussed for the proposed Oakley Dam, around which has developed a classic example of controversy in land and widely divergent social values. The Corps of Engineers proposes a dam downstream from Allerton Park (an estate owned by the University of Illinois) for flood control, water supply and recreation for Decatur, and storage for low-flow dilution of treated wastes. The project received great criticism because inumdation would ruin parkland, and construction cost estimates rose. A third party to the controversy is the city of Decatur, which has consistently been in strong support of the project because of an urgent water supply problem. The Illinois Division of Waterways has proposed a 'modified project' in order to bring the various parties together. The Committee on Allerton Park, a group of conservationists,has added to the controversy with publicity pointing to the destruction of bottom lands. It is hoped that a system will develop of weighing the environmental impacts as projects are being studied. (Wray-Chicago)

Metcalf and Eddy, Inc., Palo Alto, Calif.

Oct 30, 1964. 93 p, 4 fig, 32 tab, 37 ref.

Descriptors: *Agricultural chemicals, *Deltas, *Drainage effects, *Water quality, *Farm wastes, *Industrial wastes, Municipal wastes, Nutrients, Pesticides, Recreation, Algae, Oxygen demand, Water pollution, Municipal water, Water requirements, Water conveyance, Water costs, Artificial water courses, California.
Identifiers: *Contra Costa County, Water deterioration, Drain, San Joaquin Valley Master Drain, San Francisco Bay-Delta.

The probable effects on the offshore waters of Contra Costa County, California by the proposed drain which will convey agricultural subsurface waste waters from the San Joaquin Valley and wastes from the San Luis Division of the Central Valley Project are discussed. The point of discharge would be the San Joaquin River in the vicinity of the Antioch Bridge. Discharge is expected to begin in 1969 at a rate of 75 cfs and increase to 900 cfs by 1995. Serious deterioration of the quality of offshore waters can be expected by 1975. Acquatic life and recreational use of the offshore waters could be seriously affected by the discharge of nutrients and pesticides from the drain. Nutrients are expected to have a greater effect than pesticides. The nutrients in the drain will produce growths of algae in the drain which by their death and decay will exert an oxygen demand in the river and bay varying from 7500 lbs per day in 1975 to 27,000 lbs per day in 1995. Industry and the City of Antioch will be able to use river water a lesser proportion of the time to satisfy high quality require-

ments. The discharge of the drain will have no significant effect on water for agricultural use. (Poertner)

BAY-DELTA WATER QUALITY SUBCOMMITTEE PRELIMINARY REPORT.
Sierra Club, San Francisco, Calif., San Francisco Bay Chapters.

June 1968. 24 p, 35 ref.

Descriptors: *Estuarine environment, *Bays, *Water quality, *Water pollution control, Water circulation, Water supply, Water demand, Saline water intrusion, Water conservation, Deltas, Thermal pollution, Agricultural chemicals, California.
Identifiers: *San Francisco Bay-Delta, *Sacramento-San Joaquin Delta.

The diversion of water is discussed from the San Francisco Bay-Sacramento-San Joaquin Delta estuarine system. Planned reductions in Delta outflow to a 1500 cfs minimum will promote salt water intrusion into Delta waterways. Inflow reductions will also adversely affect water quality within the Bay-Delta system. Upstream storage and diversion projects will probably reduce seasonal 'purging' flows to insignificance. Continued increasing discharge of human and industrial wastes into the system may overload its assimilative capacity, especially with reduced advective flows. The planned introduction of agricultural drainage wastes may have adverse effects on the region's aquatic ecology. Construction of a canal from the pumps to bypass the Delta is probably necessary to mitigate the effects of increased pumping on fishery and water quality. Peripheral Canal intake facilities may prove to be a severe handicap to migrating fish. The proposed widening and deepening of navigational channels may have possible adverse effects on water quality by allowing salt water to intrude below reduced fresh water outflows. Thermal pollution, although not discussed, may reduce oxygen content, alter marine biota, and interfere with migrating fish. Recommendations are presented to avert these problems. (Poertner)

CONTRA COSTA COUNTY AND THE PERIPHERAL CANAL,
Contra Costa County Water Agency, Martinez, Calif.
John A. Nejedly.
Statement before the Superior California Water Association, Red Bluff, Jul 10, 1968. 14 p.

Descriptors: *Deltas, *Water transfer, *Water rights, *Water resources, Costs, fisheries, Legislation, Industries, Agriculture, Municipal wastes, Recreation, Striped bass, California, Estuarine fisheries.
Identifiers: *Contra Costa County, *Peripheral Canal, Southern California, San Francisco Bay-Delta.

The statement presented the views of Contra Costa County on the proposed Peripheral Canal. The canal, a 43 mile closed conduit approximately 360 to 530 feet wide, 30 feet deep, with a maximum capacity of 22,000 cfs, will enable Federal and State water agencies to transport water from the Delta to Southern California. Contra Costa County is opposed to the project because complete control over the waters flowing into the Delta would be given to the Bureau of Reclamation and the Department of Water Resources. A study made by the Metcalf and Eddy engineering firm presents costs estimates. It is estimated that, by the year 2000, increased costs in the County resulting from the water export will be $2.2 million to industrial entities using Delta water, $1.8 million to the agricultural industry, $0.9 million for municipal water supplies, and $2 million in additional waste treatment costs, or a total of 6.9 million additional costs. Because of estimating difficulties, no dollar figures were placed on losses to the recreational and sport fishing industries. The County requires an agreement, that protects the Delta, which should be incorporated in a judgment by a court of competent jurisdiction and embedded in Congressional and State legislation. (Poertner)

STATEMENT OF THE BOARD OF SUPERVISORS OF CONTRA COSTA COUNTY REGARDING THE REPORT OF THE U.S. BUREAU OF RECLAMATION ON THE FEASIBILITY OF THE 'PERIPHERAL CANAL UNIT CENTRAL VALLEY PROJECT, CALIFORNIA'.
Board of Supervisors of Contra Costa County, Martinez, Calif.

Presented before the Senate Committee on Water Resources and the Assembly Committee on Water, Sacramento, California, September 17-18, 1969. Sep 10, 1969. 6 p.

Descriptors: *Deltas, *Estuarine environment, *Water transfer, *Balance of nature, *Canals, Sedimentation, Eutrophication, Flow characteristics, Water levels, Estuarine fisheries, Bays, California, Water conveyance, Diversion.
Identifiers: *San Francisco Bay-Delta, Contra Costa County, Peripheral Canal Unit, San Joaquin Valley.

The statement presented the viewpoint of Contra Costa County, California regarding a report prepared by the U.S. Bureau of Reclamation. That report, entitled 'Peripheral Canal Unit, Central Valley Project, California, A Report on the Feasibility of Water Transfer in the Sacramento-San Joaquin Delta', is concerned with a facility that will transfer water originating in the Sacramento River Basin and Delta to the San Joaquin Valley. Officials of Contra Costa County believe that the facility will alter the hydrology and, consequently, the economy, ecology and environment of the entire San Francisco Bay-Delta system. Contra Costa County has found the Bureau's report to be silent with respect to protection of the San Francisco Bay System. The County claims that this is a shortcoming which must be remedied before the report is approved by the Governor. Some of the areas of concern are: deposition of sediment, algal blooms in slow moving water, areas of poor water quality due to flow patterns, lowering of water levels, and accelerated eutrophication of shallower channels. (Poertner)

EFFECTS OF PLANNED FRESH WATER DIVERSIONS ON THE SAN FRANCISCO BAY AND SACRAMENT—SAN JOAQUIN ESTUARY,
California Univ., Davis. Dept. of Civil Engineering.
Ray B. Krone.
Report to the San Francisco Bay Conservation and Development Commission, May 21, 1970. 7 p, 1 fig.

Descriptors: *Deltas, *Bays, *Water quality, *Water pollution control, *Diversion, Sediments, Water circulation, Absorption, Nutrients, Pesticides, Algae, Dredging, Estuarine environment, California Water conveyance, Canals, Heavy metals.
Identifiers: *San Francisco Bay-Delta.

The effects are discussed of the planned diversion of fresh water flows and suspended sediments from the San Francisco Bay and Sacramento-San Joaquin Estuary. Sediment is carried into the Bay System with fresh water inflows. Bay sediments have three outstanding effects: they impair the penetration of light, they absorb tremendous amounts of toxic materials, and clog navigable waterways. The turbidity caused by suspended sediment materials limits the depth to which there is sufficient light for algae to multiply. Since nutrients for algae growth are plentiful in the bay, the limited light penetration due to sediment is the limiting factor to the rapid multiplication of algae in the Bay. The sediments also absorb toxic compounds, such as heavy metals, pesticides, and radioactive fallout. The only foreseeable benefit of the reduced sediments are reduced dredging costs. The report recommends that comprehensive studies be made of the reduced water and sediment inflows; that criteria be established as a basis for regulating fresh water diversion; that an adequate monitoring system be maintained; that the constituent levels and locations of waste discharges to the system be regulated; that new methods of treatment of waste waters for removal of nutrients and toxic materials be developed and supported. (Poertner)
W71-09581

REDUCED FLOWS AND THE FUTURE ECOLOGY OF THE BAY-DELTA SYSTEM,
California Univ., Davis. Dept. of Zoology.
Charles R. Goldman.
Report to the San Francisco Bay Conservation and Development Commission, May 21, 1970. 11 p, 1 fig.

Descriptors: *Deltas, *Bays, *Ocean circulation, *Eutrophication, *Wetlands, *Diversion, *Ecology, Saline water intrusion, Estuarine environment, Watershed management, Nutrients, Algal, Fisheries, Sediment, California, Water circulation.
Identifiers: *San Francisco Bay-Delta, Inorganic turbidity.

Ecological implications are summarized of reduced freshwater discharge into the San Francisco Bay-Delta system. A greater intrusion of salt water and a longer retention time for plant nutrients washed in from the Delta, or discharged into the Estuary, is one result. In addition, the quantity of suspended sediments entering the Delta will be reduced. These provide much of the present turbidity in the system. The inorganic sediment particles act to remove phosphorous and heavy metals by collecting on their surfaces and carrying them to the bottom. In all probability, the decrease in inorganic turbidity will be compensated for by a increase in planktonic algae--in response to higher nutrient levels, increased temperature, increase in light transmission, and the longer average retention time of a random unit of water in the system. Unless a very high percentage of the agricultural drainage, as well as domestic pollutants, are by-passed around the Delta to an ocean sewer outfall, we can expect a general eutrophication of the Delta. Synoptic studies of the entire Bay-Delta should be undertaken now to assess the variations in fertility already existing in order to provide a baseline knowledge for any future change that may take place. (Poertner)
W71-09582

COMPREHENSIVE WATERSHED MANAGEMENT-THE ANADROMOUS FISHERY RESOURCE,
Contra Costa Coll., San Pablo, Calif. Dept. of Biology.
Fred H. Tarp.
Report to the San Francisco Bay Conservation and Development Commission, May 21, 1970. 7 p, 1 fig.

Descriptors: *Deltas, *Bays, *Diversion, *Anadromous fish, *Fisheries, Estuarine environment, Eutrophication, Saline water intrusion, California, Striped bass, Salmon, Estuarine fisheries.
Identifiers: *San Francisco Bay-Delta, *Peripheral Canal, San Joaquin River, Sacramento River.

The San Francisco Bay-Delta anadromous fish are discussed along with the effects which will result if the proposed Peripheral Canal is built to export water to the San Joaquin Valley and the Los Angeles lowlands. Reduced flows into the Delta will result in salinity intrusion and the provisional rim-flow channels will markedly reduce the dead-end sloughs as a habitat. In addition, increased water transparency and possible temperature effects will affect survival. The andromous fisheries resource

of the Bay-Delta estuarine system consists of Striped Bass, King Salmon, Steelhead Trout, Shad, and Sturgeon. At present, the species are endangered by artificial eutrophication, biocides, and toxicants as they pass through the estuarine system in their migrations. The effects of these factors will be aggravated by water export which is the principal operating force responsible for the destruction of environments of anadromous species. There are many gaps in present knowledge of physicochemical and dynamic parameters of species in the Delta. It will take at least ten years of intensive study to fill in the present gaps. (Poertner)
W71-09583

STATEMENT OF THE BOARD OF SUPERVISORS OF CONTRA COSTA COUNTY, REGARDING EFFECT OF REDUCED OUTFLOW UPON THE SAN FRANCISCO BAY-SACRAMENTO-SAN JOAQUIN DELTA ESTUARINE SYSTEM.
Board of Supervisors of Contra Costa County, Martinez, Calif.

Presented before the Senate Select Committee on Salinity Intrusion in Agricultural Soils; San Francisco Bay-Delta Area Fact Finding Hearing, November 18-19, 1970, Martinez, Nov 17, 1970. 20 p, 2 fig.

Descriptors: *Saline water intrusion, *Tidal effects, *Estuarine environment, *Deltas, *Water pollution control, Discharge (Water), Stratified flow, Sedimentation, Estuarine fisheries, Farm wastes, Industrial wastes, Municipal wastes, Bays, Ocean circulation, Striped bass, California.
Identifiers: *San Francisco Bay-Delta, Contra Costa County, Peripheral Canal.

The proposed export is discussed of San Francisco Bay-Sacramento-San Joaquin Delta water to the southern portion of the state by the Federal Central Valley Project Pumping Plant at Tracy, and the State Water Project Delta Pumping Plant. The reduced Delta outflow could cause serious and drastic effects on the environment by way of salinity intrusion deeper into the Delta and by creating a potential for massive algal blooms. This would have a drastic adverse effect upon the natural and economic resources of the Bay-Delta System. The most important effect on the Delta's migratory fishery resulting from reduced Delta Outflows would be the deterioration of the spawning grounds of the striped bass which can only spawn in fresh water. Any deterioration of the Delta's fishery causes an ancillary adverse effect on the recreational industry. The 'Kaiser Report' emphasized that even with a high degree of treatment provided for all municipal and industrial waste dischargers to the Bay-Delta System, adequate flow of water through the system for flushing purposes is still required. Regarding legislation in this field, the salinity control function of the Central Valley Project and the State Water Project must be fully clarified before other legislation is written. (Poertner)

E. D. McAlister, William McLeish, and Ernst A. Corduan.
Journal of Geophysical Research, Vol 76, No 18, p 4172-4180, June 20, 1971. 9 p, 1 fig, 5 tab, 2 ref. NSF Grants GA-1491 and 11975.

Descriptors: *Heat balance, *Sea water, *Remote sensing, *Infrared radiation, Solar radiation, Heat budget, Heat flow, Meteorology, Water temperature, Convection, Heat transfer.
Identifiers: *Heat flux (Sea water).

Airborne measurements of the total heat flux from the sea were successfully made during the Barbados oceanographic and meteorological experiment in May 1969. The values found at night ranged from 0.05 to 0.45 cal per sq cm per min and are half-hour averages over contiguous strips of ocean 1.6 km km and 75 meters wide. These are the first airborne measurements of this oceanic factor and the method used is new. (Knapp-USGS)

Identifiers: *USSR, Tashkent, Tectonics, Tectonic stress, Geostatic pressure, Epicenters, Focus, Hydrochemistry.

Gradual accumulation of stress in the region of earthquake focus affects pressures in the strata and, consequently, groundwater pressure heads. The prediction of earthquakes from hydrogeological data is dependent upon the fixed relationship between changes in stress in the region of focus at various stages of the process preceding an earthquake and the reaction of the 'borehole-aquifer' system. Aquifers are most susceptible to changes in stress in the region of potential focus. The most important factor influencing the groundwater in zones of hydrodynamic anomalies is the effect of geostatic pressure and tectonic stress on fluids. The effectiveness of hydrogeological observations of stress will depend upon the hardness of rocks making up the aquifers and impervious beds, the piezoconductivity of aquifers, the depth of focus, and the intensity of the tectonic processes. Although stress studies are being conducted in regions of potential foci by observations of groundwater pressure heads, the hydrodynamic method requires verification and should be used in combination with other methods dealing with variations in geophysical fields in seismic regions. waters, Topography, Hydrology, Geology, Solids, Vegetation.
Identifiers: *High altitude photography, Imagery simulation.

Ground observations of selected features from Earth Resources Technology Satellite imagery, high-altitude aircraft, and Apollo 9 multispectral photography were made over lands under Department of the Interior administration in eastern Arizona. The field work is supplemental to an earlier effort dated May 1970. The data is compared to that which was found in field investigations. The Safford area is drained primarily by the Gila River, which usually has only a trickle of water in its course during the summer. The black and white infrared photo showed some water present during the overflights. Water contrasts extremely well in the infrared. It is a good absorber and appears very black in relation to the generally light gray background. Numerous detention structures were detected on the photography, even though no water was present behind them. The Goat Well Detention Dam, located west of the Whitlock Mountains, is a curved structure 1 mile long. The June visit to the area found all tanks and detention structures to be devoid of water. Some springs were seen, and one well more than 2,800 feet deep was spurting forth water at about 120 deg F. (Woodard-USGS)

PRACTICAL REMOTE SENSING, THE USE OF A THERMAL MAPPER IN STUDIES OF COOLING WATER DISCHARGES FROM OPERATING THERMAL POWER PLANTS,
Pacific Gas and Electric Co., Emeryville, Calif.
M. J. Doyle, Jr., and Vern W. Cartwright.
American Congress on Surveying and Mapping Annual Convention, American Society of Photogrametry, March 10-14, 1969, Washington, D.C.

Descriptors: *Thermal pollution, *Mapping, Remote sensing, Surveying instruments, Temperature, Infrared radiation, Thermal powerplants, Thermal radiation, Isotherms, Estuaries, Water pollution sources.

The use of a thermal mapper in determining the extent of cooling water discharges from operating thermal power plants is discussed. A basic description of the mapper, its output and ground truth methods are included. Application of computer data reduction techniques to thermal mapper output provides a comprehensive representation of the surface makeup of the discharged cooling waters. A method of subsurface measurement and the development of data analysis techniques designed to yield a better understanding of the mechanics of thermal discharges is presented. The airborne remote sensing instruments have been used for the study of surface waters adjacent to operating thermal power plants. The thermal mapper used in these studies was a Bendix Model TM/LN-1. GROUNDWATER DATA AS OF 1967--CENTRAL COASTAL SUBREGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
J. S. Bader.
Geological Survey Open-file Report, March 5, 1969. 16 p, 1 fig, 30 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Water table, Water level, Water yield, Reviews, Specific capacity, Withdrawal, Pumping, Groundwater recharge, Water temperature, Water quality, Dissolved solids, Chemical analysis, Water resources development.
Identifiers: *Groundwater resources.

Most usable groundwater in the predominantly mountainous Central Coastal Subregion occurs in alluvium-filled valleys and coastal plains and in deeper aquifers of Quaternary and Tertiary age. The intervening mountainous areas are underlain by consolidated sedimentary, igneous, and metamorphic rocks, mainly of Mesozoic age. These older rocks contain only small quantities of recoverable groundwater. Total storage capacity of 16 of the 24 basins is more than 20,000,000 acre-feet. The usable storage capacity of 18 of the basins is more than 7,600,000 acre-feet; the limiting factors are sea-water intrusion and high pumping lift. Groundwater temperature ranges from about 55 deg to about 75 deg F. The dissolved-solids content of the water is generally less than 800 parts per million, but locally is more than 11,000 parts per million. The predominate water type is calcium bicarbonate. Properly constructed wells in some areas can yield as much as 425 gallons per minute. (Woodard-USGS)
W71-09649

GROUNDWATER DATA AS OF 1967 - SOUTH COASTAL SUBREGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. S. Bader.
Geological Survey Open-file Report, March 5, 1969. 21 p, 1 fig, 97 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Aquifer characteristics, *California, Reviews, Water levels, Water table, Water yield, Specific capacity, Withdrawal, Pumping, Water temperature, Groundwater recharge, Water quality, Chemical analysis, Dissolved solids, Aquifers, Hydrogeology, Water resources development.
Identifiers: *Groundwater resources.

Most usable groundwater in the predominantly mountainous South Coastal Subregion occurs in alluvium-filled valleys and coastal plains and in deeper aquifers of Quaternary and Tertiary age. The intervening mountainous areas are underlain by consolidated sedimentary, igneous, and metamorphic rocks, mainly of Mesozoic age. These older rocks contain only small quantities of recoverable groundwater. Total storage capacity of the 44 basins for which determinations have been made is nearly 100,000,000 acre-feet. The usable storage capacity is more than 800,000 acre-feet; the limiting factors are possible sea-water intrusion, thin alluvial material, and, locally, high pumping lift. Groundwater temperature ranges from about 55 deg to about 90 deg F, but locally is as high as 164 deg F. The dissolved-solids content of the water is generally less than 1,000 parts per million, but locally is more than 36,000 ppm. The predominant water type is calcium bicarbonate. Properly constructed wells in some areas can yield as much as 4,850 gallons per minute. (Woodard-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR PIN OAK CREEK, TRINITY RIVER BASIN, TEXAS, 1969,
Geological Survey, Austin, Tex.
B. B. Hampton, and D. R. Myers.
Geological Survey Data Report, 1970. 28 p, 2 fig, 4 tab.

Descriptors: *Surface waters, *Hydrologic data, *Data collections, *Texas, *Rainfall-runoff relationships, Floods, Storms, Flood control, Floodwalls, Stream gages, Discharge measurement, Flow rates, Water quality, Chemical analysis, Meteorological data, Hydrographs, Mass curves, Small watersheds.
Identifiers: *Pin Oak Creek (Tex), Trinity River basin (Tex).

This report contains rainfall and runoff data collected during the 1969 water year for the 17.6-square-mile area above the stream-gaging station Pin Oak Creek near Hubbard, Texas. The locations of floodwater-retarding structures and hydrologic instruments in the area are shown. The average rainfall during the 1969 water year was 28.42 inches, or 81 percent of the 12-year (1957-69) average of 35.30 inches. Rainfall was scattered throughout the year with every month receiving some rainfall. The monthly rainfall totals ranged from 0.09 inch in July to 5.46 inches in April. The mean daily discharge at the stream-gaging station Pin Oak Creek near Hubbard was 7.53 cfs, compared with the 13-year (1956-69) average of 11.8 cfs. The annual runoff was 5,450 acre-feet, or 5.81 inches which represents 20 percent of the total rainfall. Computations along with hydrograph and mass curves for storms are shown. Analyses are

given for two chemical-quality samples from Pin Oak Creek near Hubbard. The water contained calcium and bicarbonate as the predominant ions. (Woodard-USGS)

A FAST FRACTIONAL GAUSSIAN NOISE GENERATOR,
IBM Watson Research Center, Yorktown Heights, N.Y.
Benoit B. Mandelbrot.
Water Resources Research, Vol 7, No 3, p 543-533, June 1971. 11 p, 1 fig, 4 tab, 14 ref.

Descriptors: *Statistical methods, *Markov processes, *Stochastic processes, *Statistical models, *Mathematical models, Synthetic hydrology, Simulation analysis, Probability, Statistics, Systems analysis.
Identifiers: *Gaussian noise.

By design fast fractional Gaussian noises (ffGn) have the following characteristics: The number of operations needed to generate them is relatively small. The long run statistical dependence that they exhibit is strong and has the form required for self similar hydrology. Their short run properties, as expressed by the correlations between successive or nearly successive yearly averages, are adjustable (within bounds) and can be fitted to the corresponding short run properties of records. Extension to the multidimensional (multisite) case should raise no essential difficulty. Finally, their definition, as sums of Markov-Gauss and other simple processes, fits the intuitive ideas that climate can be visualized as either unpredictably inhomogeneous or ruled by a hierarchy of variable regimes. CONTROL OF INFILTRATION AND INFLOW INTO SEWER SYSTEMS.
American Public Works Association, Chicago, Illinois.

Copy available from GPO Sup Doc as , $1.25; microfiche from NTIS as PB-200 827, $0.95. Environmental Protection Agency, Water Quality Office, Water Pollution Control Research Series 11022 Eff 12/70, December 1970. 121 p, 12 fig, 43 tab, 135 ref. Contract 14-12-550, Environmental Protection Agency, Water Quality Office.

Descriptors: *Infiltration, *Inflow, *Sewers, *Sanitary engineering, *Leakage, *Inspection, Drainage effects, Design criteria, Design standards, Design flow, Maintenance, Repairing, Joints (Connections), Cracks, Manholes, Surveys, Discharge (Water).
Identifiers: *Illegal connections, *Exfiltration, Roof drains, Foundation drains, Basement drains, Construction allowance.

Problems were studied of infiltration of ground and surface waters into sanitary sewers and inflows from various connections to these sewers. The 'infiltration' water is surface or groundwater that enters sewers through joints, cracks, breaks or indirectly through perforated or loose manhole covers or other faulty sewer structures. 'Inflow' water is piped into the sewer from basement and foundation drains, roof leaders, and other legal or illegal connections of storm sewers and combined sewers. Two hundred and twelve public jurisdictions in the United States and Canada were contacted, and twenty-six communities were visited. Practices of consulting engineers and state and provincial water pollution control agencies were also surveyed. The surveys indicated that infiltration and inflow are widespread problems. Reduction of infiltration should be stressed in both new and old systems. For new sewers a construction allowance of no more than 200 gallons per day per inch of diameter per mile of pipe is recommended. Existing systems must be extensively investigated to determine the extent and location of infiltration. Reduction of inflow waters can be accomplished after sources of such flows have been identified, alternate methods of disposal identified, and the backing of public and governing bodies secured. Twenty recommendations are given indicating the need for extensive investigation of the extent of the infiltration/inflow problem before relief sewers are constructed or waste water treatment plants built or enlarged. (Poertner)

OIL-WELL CEMENTING PRACTICES IN THE UNITED STATES.

Produced by the committees on Drilling and Production Practice, Division of Production, API. New York, American Petroleum Institute, 1959, 297 p 2356 refs.

Descriptors: *Cementing, *Oil industry, *Drilling, Drilling equipment, *Water wells.
Identifiers: History of cementing, API standardization, Physical properties of cement, Surface cementing equipment, Primary cement, Job testings, Squeeze cementing, Deep well cementing, Cementing in lost-return zones, Regulations.

Each year in the United States several thousand wells are drilled and completed - some productive of oil or gas and some dry - and during this drilling and completion most of these wells are cased, with the casing set in the bore hole surrounded by oil-well cement. This book has been written about the process of placing this cement and it covers how this and related operations are carried out. The compositions used in cementing are basically portland cements or cements prepared by supplementing portland with additives or by variations in grinding or other manufacturing processes. Compositions other than portland cement are sometimes used in wells and often applied using methods closely similar to those used with portland cement. However, this book should in no way be interpreted to mean that portland-cementing methods can invariably be used with other compositions. Some parts of the process of 'cementing a well' are closely similar wherever they might be carried on; while other parts may vary widely, dependent upon geographical location. Nomenclature or terminology particularly vary from one area to the next. This book attempts to fill this gap. It is very well illustrated and referenced. (Campbell-NWWA)

CASING DETECTOR AND SELF-POTENTIAL LOGGER,
Wisconsin State Univ., Superior.
M. H. Frimpter.
Groundwater, Vol 7, No 6, p 24-27, November-December 1969, 5 fig, 5 ref.

Descriptors: *Water wells, *Casing, *Logging (Recording), Water table, Aquifer characteristics, Groundwater.
Identifiers: *Casing length measurements (Wells), Galvanometer, Construction, Operation.

A simple and rapid method of determining casing length and permeable zones in wells tapping bedrock can be useful to sell drillers and hydrologists. A device consisting of a galvanometer, a reel of insulated wire, and a copper electrode locates the casing depth, changes of lithology, and permeable zones. The small-diameter electrode permits measurement through well-seal access ports avoiding the expensive and time-consuming procedure of removing the seal and drop pipes to measure casing depth with a magnet. The measured electromotive force changes rapidly when the electrode passes the end of casing. Thus, the depth of casing is easily determined from the length of wire payed out. Changes in electromotive force measured within the uncased part of a well frequently indicate permeable zones, thereby aiding in choice of the most efficient drop-pipe length, and also yielding useful information for hydrogeologic studies. (Campbell-NWWA)

DIRECT CONDUCTANCE METHOD OF MEASURING CASING LENGTHS,
Idaho Bureau of Mines and Geology, Moscow; and Adco Drilling and Research, Inc., Lewiston.
S. H. Ross, and G. Adcock.
Groundwater, Vol 7, No 4, p 26-27, July-August 1969.

Descriptors: *Water wells, *Casing, Water table, Groundwater.
Identifiers: *Casing length measurements (Wells), Water-level indicator.

The standard water-level indicator can be easily and inexpensively modified so that it also measures casing lengths. The simple modification permits electrical current from one wire of the two-wire probe to be routed through the metal casing. The semiquantitative method works well with most metal casings, including nonmagnetic ones, and can be used to detect most casing reductions. The method is limited in that it works only below the water level in the well, and in that it cannot easily detect casing reductions when the conductance between the upper and lower casings is low. (Campbell-NWWA)

CORROSION OF WELL POINTS AND PIPING IN DOMESTIC WATER NEAR AEC PLANT,
E. I. duPont DeNemours and Co., Aiken, S.C. Savannah River Lab.

E. C. Hoxie.
Groundwater, Vol 2, No 3, p 45-48, July 1964, 1 ref, 6 fig.

Descriptors: *Well points, *Corrosion, *Groundwater, Wells, Screens, Cathodic protection.
Identifiers: *Well point failure, Water analyses, Metallographic examination, AEC plant, Galvanized pipe, Water treatment, Alternative materials of construction.

Describes investigation made to determine cause of excessive corrosion of construction materials of wells supplying domestic water to communities bordering atomic energy plant in South Carolina. Corrosion resulted from natural corrosiveness of soft water with high carbon dioxide and oxygen contents. No effect from atomic energy plant was indicated. This problem was brought to the attention of the AEC by a well driller and local resident who believed that the corrosiveness of the water had increased since the start-up of operations at SRP approximately ten years ago. One of the puzzling features of the problem was that some wells gave good service for seven years or more while others failed in only a year and a half. Corrosion was concentrated below the water level. (Campbell-NWWA)

PACKER TESTING IN WATER WELLS NEAR SARASOTA, FLORIDA,
U.S. Geological Survey, Sarasota, Fla. Water Resources Div.
H. Sutcliffe, Jr., and B. F. Joyner.
Groundwater, Vol 4, No 2, p 23-27, March 1966, 1 tab, 5 fig.

Descriptors: *Water wells, *Aquifer characteristics, *Artesian wells, Wells, Subsurface waters, Casing, Florida, Limestone, Water quality.
Identifiers: *Packer testing (Wells), Inflatable packer.

During February and March 1964, the U.S. Geological Survey ran caliper, conductance, and temperature logs on several wells in the Sarasota area. The Florida Geological Survey had previously run gamma ray and electric logs on the same wells. Two flowing wells were selected for packer testing. The two wells are about the same depth, penetrate essentially the same geologic horizons, and are about 16 miles apart. The packers were set in the wells between the producing horizons of the formations penetrated and each of the horizons was tested for head, amount of production, and quality of water. One of the tests produced excellent results, indicating that the various producing zones were effectively isolated by the packers and that different quality of water, quantity of water, and a different head was available from each zone. The other test did not show sharp differences but did indicate the extent of contamination of the producing horizons in a flowing well which had been capped for approximately two years. These tests indicate that packer testing can measurably add to knowledge of the separation of permeable zones. (Campbell-NWWA)

ECONOMIC APPLICATION OF INSERT BITS,
Dresser Industries, Inc. Dallas, Tex.
G. C. Jackson.
30th Annual Meeting American Association of Oilwell Drilling Contractors, September 22-25, 1970, 12 p, 6 fig.

Descriptors: *Drilling, *Rotary drilling, *Drilling equipment, Oil industry, Wells.
Identifiers: Sealed bearing insert bits, Field performance, Limits of performance, Drillability.

Sealed bearing insert bits have proven to be economical in a wide variety of applications previously drilled by sealed and nonsealed milled tooth bits. Economic performance of the relatively new 'medium' and 'soft' types has been obtained mostly on the basis of extrapolation of past experience with 'harder' type bits. The full economic potential of these 'softer' types may have not been achieved. A practical approach to evaluating the possible economy of a sealed bearing insert bit is to examine past performance of milled tooth bits, the logs and the mud programs which produced that performance. A cost analysis of the bit record and a study of the bit record in conjuction with the log and recorded dull condition have proven to be a good approach. Long intervals of similar drillability and cost per foot usually lend themselves to the economical application of a sealed bearing insert bit. Drilling problems, such as deviation, undergage sections and lost circulation, are added cost incentives. (Campbell-NWWA)

THE GROUND WATER CONSULTANT LOOKS TO THE DRILLER,
Guyton (William F) and Associates, Austin, Tex.
M. L. Klug.
Ground Water, Vol. 4, No. 4, p. 20-22, October 1966.

Descriptors: *Drilling, *Water wells, Logging (Recording), drilling equipment.
Identifiers: *Ground water consultant, *Well contractor, Geologic information, Well construction, Sieve analysis, Well performance, Sand control.

The consultant expects the driller to provide good data and competent performance. Exchange of views associated with drilling and construction can prove to be mutally beneficial. Contacts between the consultants and the drillers have a tendency to upgrade the quality of the basic data collected. These contacts may aid the driller in delivering full performance and thus improve the overall quality of the drilling and construction he performs for the client. As a result, everybody associated with the water well industry - drillers, consultants, and clients - stands to gain by these contacts. It is hoped that these beneficial contacts within the water well industry will become even more common in years to come so we all can gain from one another's knowledge and experience. (Campbell-NWWA)

SUCCESSFUL ACIDIZING,
Dowell, Inc., St. Louis, Mo.
I. R. Bielek.
Water Well Journal, Vol. 10, No. 8, p. 9, 24-26, 29, 7 tab., 4 ref., August 1956.

Descriptors: *Acidizing, *Water wells, *Stimulation (wells), Aquifer characteristics, Screens, Specific capacity.
Identifiers: Carbonate deposits, Iron deposits, Micro-organisms, Backwashes.

As a result of the survey the effectiveness of the new acidizing techniques, incorporating backwashing and surging, has been established. These techniques have proved effective for use in preventing rapid fall of water levels and steep decline curves resulting from blocking of screens and flow channels by formation particles. For maximum success in an acidizing treatment, all pertinent data should be studied and evaluated. The well history, water analysis, subsurface logs, and past experience are valuable guides in adapting proven techniques to the individual well. Even if the treatment fails to produce the desired production boost sufficient information may be obtained to formulate a successful workover program or prove the well economically dead. (Campbell-NWWA)

ROTARY DRILLING MUDS,
Nebraska Univ., Lincoln. Conservation and Survey Div.
V. H. Dreeszen.
Water Well Journal, Vol. 13, No. 7, p. 18-20, September 1959, 4 fig., 10 ref.

Descriptors: *Water wells, *Rotary drilling, *Drilling fluids, Wells, Muds.
Identifiers: Cuttings, Mud pit, Well pressure, Filter cake, Caving, Lubrication.

The protection and development of water from permeable formations can be a problem with any type of well drilling method. The methods for protecting water-bearing formations when the rotary method of drilling is used are discussed. The methods are: remove all the cuttings from the hole, do not recirculate cuttings (keep the drilling mud clean), and use a low filter-loss mud to build a thin filter cake opposite permeable formations and to prevent sloughing of silt and clay formations. The drilling mud must be removed from the drilled hole and from the hole walls in order to develop a producing well satisfactorily. The paper is well referenced. (Campbell-NWWA)

SOME PRINCIPLES AND DEVELOPMENTS IN HARD ROCK DRILLING TECHNIQUES,
C. Fairhurst, and W. D. Lacabanne.
6th Annual Drilling and Blasing Symposium , University of Minnesota, October 11-13, 1956. Minneapolis, p. 15-25, 2 tab., 10 fig., 10ref.

Descriptors: *Drilling, Rotary drilling, *Water wells, Rock mechanics, Drilling equipment.
Identifiers: *Percussive drilling, *Hard rock drilling, Mechanics of rock fragmentation, Wedge angle, Penetration rates, Fracture mechanism, Europe.

This paper describes the general mechanism of rock breakdown in the two most used drilling methods, namely percussion and drag type rotary. Most other systems can to a large extent be classified within these types. (Table 1) Consideration of the mechanics reveals the inherent limitations of each and indicates the reasons why the comparatively recent method of rotary-percussive drilling offers hope for improved drilling performance, especially in the harder rocks. Results obtained in practice in Europe are shown to support this view. Analysis of the basic mechanics of rotary and percussive methods of drilling indicates that each has definite limitations in application, but that it is possible to combine successfully the systems to overcome most of thsese limitations. Rotary-percussive drilling appears to offer considerable promise for much higher penetration rates in rocks previously too hard to drill by anthing other than diamond or straight percussive drilling methods. (Campbell-NWWA)

MODERN DESIGN TECHNIQUES FOR EFFICIENT HIGH CAPACITY IRRIGATION WELLS,
Universal Oil Products, St. Paul, Minn. Johnson Div.
J. W. Reinke, and D. L. Kill.
1970 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 8-10, 1970, Paper No. 70-732, 23 p., 2 tabs., 5 fig., 4 ref.

Descriptors: *Irrigation wells, *Ground water, *Water wells, Screens, Casing, Drilling, Drilling equipment.
Identifiers: *Gravel packed well, *Well efficiency, *Well development, Sand pumping, Well life, Design criteria.

Common irrigation well design problem areas are reviewed. Modern design criteria that are presented insure sand-free water, overall high efficiency and long well life. The benefits of suggested procedures are economical, low-cost irrigation wells. The initial cost of the suggested procedures and quality materials is greater than traditional completion methods but is the best investment the irrigation farmer can make. The construction, operation and maintenance costs of an efficient, sand-free irrigation well amortized over a 25-year period will be the cheapest well possible. The long-term economics of modern irrigation well design is in the interest of adding much needed profits to agriculture. (Campbell-NWWA)

DEEP-HOLE DRILLING WITH EXPLOSIVES,
A. P. Ostrovskii.
Russian text was pbulished by Gostoptekhizdat, State Scientific and Technical Publishing House of the Petroleum and Mineral Fuel Industry, Moscow, 1960. New York, Consultants Bureau, 1962, 133 p., 67 refs., 77 fig., 39 tabs.

Descriptors: *Oil industry, *Drilling, Rock mechanics, Drilling equipment.
Identifiers: *Novel drilling techniques, *Explosive drilling, Penetration rate, Method technology and technique.

The development of an effective method of drilling wells to depths of 3-5 km and more is a complex problem of great practical interest. 'Deep Hole Drilling With Explosives' is a distincitve and very interesting work of the engineer A. P Ostrovskii, who more than twenty years ago, by his original suggestions, made a start in investigating the field of so-called non-bit processes of shattering rocks when drilling holes, and with his co-workers, developed a fundamentally new explosive method of drilling deep holes. This book discusses the new trend in worldwide application of explosives in technology and the national economy; it presents considerable experimental material on the effect of explosions in solid media, material that is not only interesting to specialists in mining but also to physicists. Many phenomena discussed by the author and cited in the book still await explation, but the fact that these phenomena have been already subjected to experimental study undoubtedly adds to our knowledge of one of the most meagerly investigated areas of the science of explosions-concerning the shattering effect of explosions on solid media. (Campbell-NWWA)

WHY STRONG ACID PAYS OFF IN CARBONATE RESERVOIRS,
Dow Chemical Co. Tulsa, Okla. Dornell Div.
O. E. Harris, C. W. Crowe, and R. W. Dennis.
World Oil, Vol. 163, No. 7, p. 76-80, December, 1966, 6 fig., 1 tab., 6 ref.

Descriptors: *Aquifer characteristics, Porosity, Specific yield, *Stimulation, Limestone.
Identifiers: *Fracture acidizing, *Carbonate aquifers, Well completion, Reaction rates, Calcium chloride, Fracture penetration, Inhibition.

Hydrochloric acid in concentrations greater than the 15 percent normally used will significantly improve fracture acidizing results from carbonate reservoirs. Acid properties at concentrations above 15 percent change with increasing concentration. By understanding these changes and how and why they occur, high-strength acid can be advantageously used to provide: (1) Greater formation conductivity resulting in sustained production and injection increases. This is particularly true in reservoirs of high water saturation which make weaker solutions of acid ineffective because of rapid dilution. (2) Greater penetration, because of more rapid initial decrease in area-to-volume ratio. (3) Greater volume of CO2 gas per barrel of reacted acid. This has proved extremely effective in aiding well clean-up. (4) Greater penetration due to retardation produced by concentration increases of the acid itself and of the reaction products in solution in the partially spent acid. (Campbell-NWWA)

ROTARY DRILLING HANDBOOK,
J. E. Brantly.
New York, Palmer, 1961, 6th Ed., 825 p.

Descriptors: *Drilling, *Rotary drilling, *Wells, *Oil industry, Pumps, Drilling fluids, Mud, Cements, Casing, Pipe.
Identifiers: Bits, Air and gas drilling, Bit weight, Rotating speed, Straight-hole drilling, Fishing, Formation testing, Safety measures.

This book is one of the few comprehensive classics on rotary drilling produced by the oil industry. This 6th edition has been up-dated to include most of the common techniques in use today. It contains thirty-one chapters and covers the entire spectrum of oil well drilling methods, from the basic principles through pipe and depth measurements, cementing, and safety control. This book can be used as a single source for information on the practical aspects of rotary drilling presently used. Its value to the ground water industry is not found in the many petroleum and natural gas oriented techniques discussed but rather in the philosophy of development over the past years. Some of the techniques are, however, clearly applicable to shallow drilling with only minor modifications or extrapolations, especially the chapters on bits and cementing as well as the glossary, which contains a multitude of semi-pertinent tables, formulas, and graphs. (Campbell-NWWA)

PRINCIPLES OF DRILLING FLUID CONTROL,
American Petroleum Inst., Dallas, Tex.

Edited by Subcommittee of the API Southern District Study Committee on Drilling Fluids. Dallas, American Association of Oilwell Drilling Contractors, 1969, 215 p.

Descriptors: *Drilling fluids, *Drilling, *Rotary drilling, Wells, Drilling equipment, Oil industry.
Identifiers: Drilling fluid composition, Circulating systems, Mud systems, Lost circulation.

The fluid used in rotary drilling, once reagarded only as a means of bringing rock cuttings to the surface, is now recognized as one of the major factors involved in the success or failure of the drilling operation. In addition to lifting the cuttings, the drilling fluid must perform other, equally important functions directed toward the efficient, economical, and safe completion of the drilling operation. For this reason, the composition of the drilling fluid and its resulting properties have become the subject of much study and analysis. As attempts are made to drill deeper and consequently more hazardous wells, and to more fully exploit productive formations, the drilling fluid is expected to have physical and chemical properties that enable it to contend functions has required that the composition of the fluid become more varied and its properties more subject to control, with the result that the cost of maintaining an effective drilling fluid has become a major drilling expense in many areas. This manual discusses the well conditions which occasion the need for control of drilling fluid properties, and the most economical means of gaining and maintaining this control. The term 'drilling fluid' includes air, gas, water, and mud. The term 'mud' refers to a suspension of solids in water or oil, or of solids and droplets of one of these liquids dispersed in the other. This training manual discusses each of these drilling fluids, including the modification of muds for use as packer fluids, but deals primarily with those fluids used most often in the field, namely, suspensions of solids in a liquid, 'muds', and suspension of solids and droplets of a liquid in a second liquid, 'emulsion muds.' JET BIT MECHANICS,
Texas Univ., Austin. Petroleum Extension Service.

Petrol 1970, January, 100 p., 19 ref.

Descriptors: *Drilling, *Rotary drilling, *Drilling equipment, Casing, Pipe, Oil industry.
Identifiers: Bits, Horsepower, Rotational energy, Rock fracture, Rock-chip removal, Rock-bit design, Back pressure, Rotary speed.

Probably the most important single realization in rotary drilling is that rock must not only be fractured on bottom, but also must be removed from the rock face instantly and efficiently, to provide for further fracturing and drilling progress. For this

purpose, two types of energy sources are brought from the surface to the rock face and applied as efficiently as possible. These are: (a) Mechancial energy, applied through rotary and drill string, and converted into its most useful form through the mechanism embodied in the bit cones and teeth and (b) hydraulic energy, applied through pump and drill string conduit, and converted into its most useful form through correctly positioned jet nozzles, aimed at the rock face just ahead of the oncoming tooth. Mechanical energy is some times thought of as the medium for rock fracture, and hydraulic energy as the medium for chip removal and bottom scavenging. In fact, however, both types of energy play a part in both rock fracture and rock removal, as we shall see more clearly later in these discussions. Furthermore, although no progress can be achieved without rock fracture, it is undoubtedly the least problematic feature of rotary drilling, and our studies will in consequence be largely concerned with the more complex mechanism of rock cutting removal. Moreover, as the provision of hydraulic energy in its most useful form has already been covered in an earlier manual in this series entitled 'Jet Bit Hydraulics,' our hydraulic analysis here will be concerned principally with the manner in which the hydraulic energy assists and complements mechanical energy at the rock face. (Campbell-NWWA)

JET BIT HYDRAULICS,
Texas Univ., Austin. Petroleum Extension Service.

Austin, University of Texas, Petroleum Extension Service, 1969, 141 p., 65 fig.

Descriptors: *Drilling, *Rotary drilling, *Drilling fluids, *Pumps, Casing, Pipe, Oil industry, Drilling equipment.
Identifiers: Bits, Bit hydraulics, Pressure energy, Energy losses, Static and dynamic pressures, Drill pipe, Pressure drop at bit, Pump pressure.

Drilling nowadays is carries out at high bit loads, often combined with fast rate of rotation to achieve rapid drilling rates especially in softer rock. No such high penetration rates are possible, however, without the aid of a powerful jet stream at the drilling face, assisting the mechanical forces in the process of rock breakage and ensuring that the broken rock particles are swept free of the oncoming rockbit teeth to prevent unnecessary regrinding. The success of our drilling operation demands an adequate supply of hydraulic energy at the bit to perform this function. The cost of supplying such energy will depend, not only on the size of the pump, but on how much of its outgoing energy actually reaches the rock face and performs useful work. It is, then, clearly in the interest of those wishing to reduce footage drilling cost to maintain the hydraulic system on their rigs at a high overall hydraulic efficiency. This manual sets forth in basic terms what must be done to achieve this, and explains why such recommendations are successful. The leading requirement of a hydraulic system for a drilling rig is to provide adequate hydraulic power at the rock face, where the mechanical forces are at work fracturing and removing the rock. The second requirement of a hydraulic system for a drilling rig is to provide fracturing and removing the rock. The second requirement of the system is to provide a means of returning cuttings to the surface, for identification, in such a way as to maintain clean, stable hole condition for drilling and for the passage of bit and drill stem during round-trips. (Campbell-NWWA)
W71-09923

ROTARY DRILLING: THE BIT.

Lesson in Rotary Drilling, Unit I, Lesson 2: The Bit, 1966, 48 p., 46 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Oil industry.
Identifiers: *Roller cone bits, *Rock bit selection, Special purpose rock bits, Bit economics, Diamond drilling bits, Drag bits, Specialty bits.

The bit and the way it performs is what drilling is all about. And the bit only performs when it is on bottom. Furthermore, when it is on bottom it makes hole - and money - only when it is effective in that formation. Even then it must be in at least fair condition. There must be weight on it, which is a function of the frill collars. And it must get a hand from the drilling fluid. Finally it must be rotated. Rotation is accomplished by the rotary. Even so, there are tools called turbo-drills where rotation is accomplished by the flow of drilling fluid through a bottom-hole turbine in the drill string. The drill pipe is stationary during the drilling. These are rare exceptions at the time of this writing in 1966. Main consideration in this series will be limited to those bits which are turned by the rotary table. There are many variables in the performance of bits with respect to any given formation. These all resolve into questions of economics, that is, into the selection of the one that seems most likely to make the greatest contribution to the progress of drilling. (Campbell-NWWA)
W71-09924

ROTARY DRILLING: THE DRILL STRING.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling Unit I, Lesson 3: The Drill String, 1965, 58 p., 15 tab., 61 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Oil industry, Pipe.
Identifiers: *Drill string, *Drill pipe, Tool joints, Drill collars, Collar inspection, A.P.I. standards.

The drill string (sometimes called the drilling string) consists of the drill pipe, the tool joints, and the drill collars, together with certain accessories which are commonly used while drilling, although not always required in every situation. These accessories include stabilizers, reamers, and subs (short for 'substitutes'). Although no string of drill pipe is complete without tool joints, the two items are treated separately in order to more clearly describe each and in order to simplify discussion of maintenance of each. In the oil world today an overwhelming majority of all drill pipe is made to standards approved by the American Petroleum Institute. These standards cover the physical properties of the steel from which the pipe is made, the method of manufacture, and the physical dimensions of the pipe. These dimensions cover thread forms, wall thickness, inside and outside diameters, and length of joints of pipe. Also standardized is the weight of the pipe. By agreement between the buyer and the manufacturer, drill pipe can be bought which does not conform to these standards. The important thing is that when the purchase is made on the basis of API standards, the buyer is sure of what he is buying. (Campbell-NWWA)
W71-09925

ROTARY DRILLING: SAFETY ON THE RIG.

Issued by Petroleum Extension Service, University of Texas, Austin. Lesson in Rotary Drilling, Unit I, Lesson 10: Safety on the Rig, 1967, 51 p., 16 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Oil industry.
Identifiers: *Drilling safety, First aid, Safety equipment, Safety practices.

Following safety rules and practices is a must in the drilling business. The importance of protective measures on and around drilling rigs cannot be over-emphasized. Safety, of course, is important in everyday living. It is something we are conscious of, no matter what we do, throughout life. It is important in the home, at work or play, on streets and highways, wherever we go. Safety is emphasized much more than usual around a drilling rig because drilling is a hazardous business. It is a rewarding business for those who like it and grow with it safely, day by day. Drilling personnel must know how to work safely on a rig in order to protect themselves and the expensive equipment they operate. Several hundred thousand dollars are usually invested in a drilling rig which is depended on to 'make hole' efficiently and safely in order to make money. Drilling is a highly competitive business, with constant effort to save valuable time which represents considerable expense to the drilling contractor and to his customer, the operator. Drilling crews must be as fast and efficient as possible but speed and efficiency also require safe operating practices, since accidents and lack of safety precautions can be extremely costly - not only in injuries and damaged or lost equipment but in loss of life. (Campbell-NWWA)
W71-09926

ROTARY DRILLING: MAKING HOLE.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling, Unit II, Lesson 1: Making Hole, 1968, 55 p., 28 fig.

Descriptors: *Drilling, *Rotary drilling, *Oil industry, Drilling equipment, Drilling fluids.
Identifiers: *Bits, *Drilling time tests, Rotary factor, Hydraulic factor, Differential pressure, Drilling practices, Lost circulation, Tripping.

It is not often that everything can be ideal in drilling. Decisions on the proper course in making hole involve many compromises. A certain section to be drilled is for the most part easy digging - soft shales for example. So a long-tooth bit is run in. In the soft digging there turns up one thin section of hard rock. You dull the bit and pull it before you break out of the hard streak. You decide to run in a hard-formation bit. You drill a few feet and break out into the soft, sticky shale again. Your hard-formation bit just will not cut it. So you pull it. Now, what to do. Could be that you compromise on a bit that will make hole in the soft stuff - though not as fast as you might like. But it will also stay with you longer if you hit another hard stringer. This is a compromise bit that is less than ideal in either the soft digging or the hard. The business of making hole is often a long series of such compromises. To make the right decision the driller and pusher have to be aware of the factors involved in drilling. The most significant of these will be mentioned here and discussed further along. (1) the geological section, (2) the capability of the rig, (3) the drilling fluid program, (4) the bit, (5) three critical factors: weight on the bit, rotary operation, the hydraulic factor. (Campbell-NWWA)

ROTARY DRILLING: DRILLING MUD.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling, Unit II, Lesson 2: Drilling Mud, 1968, 98 p., 24 tab., 18 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Drilling fluids, Wells, Oil industry.
Identifiers: *Drilling mud composition and properties, Conditioning drilling muds, Common drilling problems, Mud treating chemicals and additives.

The drilling fluid, originally regarded only as a vehicle for transporting cuttings to the surface in rotary drilling, is now recognized as one of the major factors involved in the success of the drilling operation. Speed, efficiency, safety, and cost of drilling depend upon the performance of the drilling fluid used. The term 'drilling fluid' properly includes gases, as well as liquids and suspensions of liquids and solids in liquids. This lesson is limited to a discussion of suspensions of solids in a liquid, 'muds', and of solids and a liquid in a second liquid, 'emulsion muds'. As attempts have been made to drill deeper and more hazardous wells and to improve exploitation of productive formations, the

drilling mud has been expected to perform more functions. To perform these functions satisfactorily, the composition of the mud has become more varied and the properties have become more subject to control. The cost of maintaining effective drilling mud is now necessarily a major item of the over-all expense of drilling in many areas. The purpose of this lesson is to discuss the need for, the methods employed in, and the most economical maintenance of effective mud control. (Campbell-NWWA)

ROTARY DRILLING: TESTING AND COMPLETING.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling, Unit II, Lesson 5: Testing and Completing, 1968, 64 p., 69 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Oil industry, Aquifers, Wells, Stimulation.
Identifiers: *Well completion, Formation evaluation methods, Nitro shooting, Acidizing, Hydraulic fracturing.

The economic purpose for drilling oil wells is to produce oil or gas. From the very earliest days it was recognized that testing the porous zones to obtain samples of the fluid contents in a well was an essential part of the drilling job. The cable tool method of drilling in fact made possible a continuous test prior to completing a well. Tests of fluid volume and pressure were accomplished while drilling continued; when the well had tested satisfactorily, or when as much fluid as possible had been obtained drilling was stopped. Sometimes the flow of oil or gas reached such a high rate while 'drillin in' a well that the need arose for a packing gland arrangement around the drilling cable. When the flow of the well began to hold up the tools to such an extent that they would go slack, the tools were pulled and the well was produced until the flow decreased so that deepening could be continued. The inability to sample formation fluids and to test production as drilling proceeded delayed acceptance of the rotary method for a long time. It was recognized that the rotary could make fast hole, but it was also evident that, when using this method, hole might be drilled through productive zones without noticing the evidence of oil or gas. The introduction of coring tools in 1921, drill stem testing (DST) in 1926, and electric logging in 1933, changed the picture completely for rotary drilling. These innovations, and others that followed, made it possible to obtain detailed information of oil and gas shows when they were encountered. Conventional coring was followed by wire line coring; both were almost completely supplanted by electric logging techniques. Drill stem testing and electric log analysis have progressed to the point that formation evaluation can be accomplished without setting casing. (Campbell-NWWA)
W71-09930

ROTARY DRILLING: FISHING.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling, Unit III, Lesson 2: Fishing 1968, 31 p., 49 fig.

Descriptors: *Drilling, *Rotary drilling, Drilling equipment, Oil industry.
Identifiers: *Fishing (Drilling), Drill pipe recovery, Drill collar recovery, Wire rope and cable recovery.

The term 'fishing' stems from the early cable-tool practice of dangling a homemade hook or spear in the hole in an attempt to snag a broken drilling line and thereby retrieve the tool attached. On modern drilling rigs, fishing has become the art and science of removing broken or stuck equipment, or small, non-drillable materials from the well bore. The fish may be anything from a part (or all) of the drill string, to smaller pieces of equipment such as bit cones, pieces of tools or any material accidentally dropped into the well bore. Even small pieces of iron pyrite, which occurs naturally in some formations, may work loose and impede drilling to the extent that they must be fished from the hole. There are many types and kinds of fishing tools. Which tools are used depends on the type of fish in the hole, whether the fish is stuck or free, whether it is in a cased or open hole, the condition of the hole at the site of the break, and the condition of the top of the fish. Each fishing job is unique, but there are some basic techniques and tools used in all of them and these will be discussed in this lesson. Furthermore, the lesson will be restricted to fishing in open hole. The term 'open hole' pertains to that part of the hole which does not contain casing. Cased-hole fishing is usually associated with production problems that occur after the drilling rig has moved away; however, some of the techniques used in open-hole fishing are also used in cased-hole fishing. (Campbell-NWWA)

8B. Hydraulics

THE FLOW OF WATER OVER AND WITHIN A PROTECTIVE LAYER OF COARSE, GRANULAR MATERIAL,
Mississippi State Univ., State College. Dept. of Agricultural and Biological Engineering.
J. C. McWhorter, and Melville S. Priest.
Available from the National Technical Information Service as PB-200 825, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Water Resources Research Institute, May, 1971, 19 p, 12 fig. OWRR PROJECT A-046-MISS (1).

Descriptors: Channels, *Oxygen channel flow, *Sedimentation, *Boundries (Surfaces), Hydraulics, *Roughness (Hydraulic), Linings, *Gravels.

The effectiveness of a layer of gravel in shifting the zone of relatively high velocity gradient and correspondingly high shear stress away from a channel bottom is shown by means of graphs. For purposes of generalization, pertinent quantities are arranged in appropriate dimensionless parameters through which the effects of bed slope, relative thickness of gravel layer, and relative size of gravel on a dimensionless velocity profile are presented. It is through comparison of dimensionless velocity profiles that effects and effectiveness become apparent.

COMPARISON TESTS OF PLAIN AND RIFLED DREDGE DISCHARGE PIPE.
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. B. Pittard, James E. Glover, and Arthur G. Davis.
Available from the National Technical Information Service as AD-722 215, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-751, Jan 1967. 50 p.

Descriptors: *Inland waterways, *Pipes, *Test procedures, *Dredging maintenance, Sedumentation, Arkansas, Tennessee, Mississippi River.
Identifiers: Hydraulic systems, Maintenance equipment, Vacuum pumps, Rifling, Dredges.

Tests were undertaken in the Memphis District to compare rifled dredge pipe with plain dredge pipe. Test results indicate that the output of the rifled pipe did not differ significantly from that of the plain pipe for lengths of 800 ft. Pipeline velocity was found to be closely related to dredge production. The rifled pipeline was equally as productive as the plain pipeline at about 18.5 fps and progressively more productive as the system was loaded to a maximum productivity at about 15 fps. However, the use of rifled pipe with present dredging methods and pipeline lengths is not justified and would be less economical than the use of plain pipe in view of greater cost of rifled pipe and increased fuel consumption. The instrumentation developed for the tests afforded better control of the dredging operation and thereby provided personnel a more positive means of improving production under varying conditions.

WILLOW SPRINGS AND SAG JUNCTION DIVERSIONS, CHICAGO SANITARY AND SHIP CANAL, ILLINOIS, HYDRAULIC MODEL INVESTIGATION.
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Thomas E. Murphy.
Available from the National Technical Information Service as AD-722 230, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-776, May 1967. 39 p.

Descriptors: *Inland waterways, *Model studies, *Flow, *Channel improvement navigation, Illinois, Flood control.
Identifiers: *Hydraulic models, Hydraulic systems, Chicago Sanitary and Ship Canal, Des Plaines River.

The Turtle Creek channel improvement plan is proposed for the lower end of Turtle Creek near Pittsburgh, Pennsylvania, to provide flood protection for a 20,000-cfs design discharge from the mouth to a point 3.8 miles upstream. The model investigation was concerned with the study of the hydraulic performance of the proposed design in the lower reach, the effect of low level bridges, abutments, and other channel constrictions, and the evaluation of various modifications to the proposed design. An undistorted model, scale 1:50, reproducing the lower 7800 ft of Turtle Creek and a portion of the Monongahela River at the confluence was used for the investigation. Tests indicated that the proposed channel would be generally adequate to carry the design discharge, provided the lower reach is maintained reasonably free of deposition. Additional reduction in stages could be obtained by realignment of the lower 800 ft of channel to eliminate projecting piers and abutments and by removing projections and obstructions remaining in the channel upstream.

TURTLE CREEK, PENNSYLVANIA, CHANNEL IMPROVEMENT. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
James E. Glover, and John J. Franco.
Available from the National Technical Information Service as AD-722 212, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-765, March 1967. 66 p.

Descriptors: *Inland waterways, *Model studies, *Flow, Sedimentation, Flood control.
Identifiers: *Hydraulic models, Pennsylvania, Turtle Creek.

Proposed diversion channels from the Chicago Sanitary and Ship Canal into the adjacent Des Plaines River at Willow Springs Road and Sag Junction, Illinois, were investigated in 1:60-scale models. Also, a 1:16-scale section model was used to study performance of the gated structures planned for regulation of flow through the diversion channels. Both diversion channels will have their bottoms in rock with concrete retaining walls above ledge rock. A roadway bridge will cross the entrance of each diversion channel, and flow through the channels will be regulated by control structures comprised of 16-ft-wide vertical-lift gates—10 gates at Willow Springs and 7 gates at Sag Junction. Impact-type stilling basins will be pro-

vided to disipate the flow through the gates. The gate structures and stilling basins performed as anticipated. Due to the flat angle at which the Willow Springs Diversion intersected the canal, flow into the diversion was concentrated near the downstream side of the entrance, creating cross-currents in the canal which were considered hazardous to navigation. Equal distribution of flow along the channel entrance and satisfactory navigation conditions in the canal were obtained by installing curtain walls, extending from above the water surface to selected elevations, along the upstream noses of the bridge piers. Navigation conditions at the Sag Junction Diversion were satisfactory. Capacity of each of the diversions was greater than the stated requirement. Calibration data, obtained in the models, should be useful in setting up normal and emergency operating schedules.

ARKANSAS RIVER NAVIGATION ENTRANCE. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco, Louis J. Shows, and James E. Foster.
Available from the National Technical Information Service as AD-722 213, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-795, Sep 1967. 50 p.

Descriptors: *Inland waterways, *Model studies, *Flow, *Navigation dams, Arkansas, Missippi River, Flood control.
Identifiers: *Hydraulic models, River currents, Flow fields, Arkansas River, White River, Flood control.

This study was concerned with the lower portion of the Arkansas River project which enters the Mississippi River through Arkansas Post Canal and White River. Tests were conducted on a fixed-bed model with a horizontal scale of 1:600 and a vertical scale of 1:100 reproducing the Mississippi River from mile 571 AHP to mile 604 AHP, Arkansas River from its mouth to a point about 56.5 miles upstream, White River from its mouth to a point 12 miles upstream, and adjacent overbank and backwater areas. Investigation was conducted to determine effects of various cutoffs on navigation, determine most favorable location for entrance into the navigation canal from Arkansas River, study the flow pattern and velocities in the entrance to the canal, and determine adequacy of proposed flood-control plan. Results of investigation indicated: Arkansas-White Cutoff would continue to develop unless preventive measures were taken. Closing Arkansas-White Cutoff with a fill near White River would essentially eliminate channel flow from the Arkansas to White River which would both improve navigation conditions and reduce the maintenance required in the navigation channel of the lower White River. Closure of cutoff would have little or no effect on stages during major floods. Development of Sawmill Bend Cutoff would increase the tendency for Arkansas-White Cutoff to develop. Development of Avenue Landing Cutoff would tend to reduce stages upstream and flow from Arkansas River toward White River through the Arkansas-White River Cutoff. No serious navigation difficulties were indicated near the mouth of White River under the conditions tested. The Project Plan would provide the best entrance conditions to the navigation canal. The dam should be placed farther downstream than originally planned and training dikes would be required at the head of the bend to improve navigation conditions and reduce the tendency for shoaling.

MODEL STUDY OF HOPPER DREDGE DRAGHEADS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco.
Available from the National Technical Information Service as AD-722 214, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-755, Jan 67. 87 p.

Descriptors: *Inland waterways, Sedimentation, *Dredges, *Model studies, Dredging.
Identifiers: *Maintenance equipment, *Hopper dredges, *Dragheads, Vacuum pumps.

This investigation was conducted to determine the factors affecting the performance of dragheads and to develop parameters for use in the design and operation of dragheads when dredging in sand. The study was conducted in a 60- by 10-ft flume with a 1:6-scale model of the draghead and suction line. The suction line was attached to a centrifugal pump mounted on a carriage which could be made to travel the length of the flume on rails set on top of the flume walls. The scope of the investigation was not sufficiently broad to permit the development of all of the relations affecting the performance of the various types of dragheads but did provide sufficient information to permit the development of indications having practical applications in the design and operation of dragheads for hopper dredges. The results indicated that in general the performance of dragheads is affected by the shape and dimensions of the draghead, position of the draghead with respect to the bed, vacuum, and dredging speed.

SANITARY SEWAGE TRANSPORT VELOCITY,
American Society of Civil Engineers, Cambridge, Mass.
M. B. McPherson, L. S. Tucker, and M. F. Hobbs.
In: Advances in Solid-Liquid Flow in Pipes and Its Application; Pergamon Press-Oxford and New York, 1971, p 221-226, 4 fig, 1 tab, 9 ref. Federal Water Pollution Control Administration Demonstration Grant WPD 104-01-66.

Descriptors: *Hydraulics, *Flow rates, *Sewers, *Settling velocity, *Pipe flow, Pipelines, Sewage disposal, Flow separation, Sediment transport, Sanitary engineering, Pressure conduits, Open channel flow, Design flow, Laboratory tests.
Identifiers: *Combined sewers, *Sanitary pressure sewers, Sewer separation.

Tests are summarized of the minimum required flow velocities of sanitary sewage in closed pressure conduits and open channels to preclude deposition of solids. Hydraulic experiments were conducted at the Central Engineering Laboratories of the FMC Corporation in Santa Clara, California using clear plastic pipe of different diameters, from 2 inch through 8 inch. Sewage analyses included determination of pH, COD, grease, total solids, total volatile solids, suspended solids, settleable solids, and specific gravity and amount of settleable solids on each of eleven sieve fractions, the last in terms of both suspended and volatile content. Because no meaningful correlation could be obtained between minimum transport velocities and sewage characteristics analyzed in the initial series of tests, sewage sand content was also determined in the final tests, including specific gravity and amount of each sand sieve fraction. Minimum sand transport velocity findings of Craven for closed conduits, and of Ambrose for closed conduits and open channel flow, are presented as correlated by Laursen. All appropriate full conduit flow data from Ambrose and Craven and the sewage tests are summarized. Velocities causing deposition of suspended solids, and also scouring, were studied. Both comminuted and uncomminuted sewage was employed. This work was conducted in conjunction with the Combined Sewer Separation Project of the American Society of Civil Engineers. It is a study of pressurized sanitary sewerage systems wherein sewage would be pumped from buildings into pressure conduits in existing combined sewers. (Poertner)

MOVEMENT OF SMALL GAS BUBBLES IN SMOOTHLY DECELERATING LIQUID,
Grumman Aerospace Corp., Bethpage, N.Y.
Subba Rao Gutti.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY7, Paper 8251, p 1117-1128, July 1971. 12 p, 7 fig, 15 ref, append.

Descriptors: *Flow, *Hydraulics, *Hydrodynamics, *Bubbles, Viscosity, Shear, Channel flow, Nonuniform flow, Unsteady flow, Flow characteristics, Fluid mechanics, Kinetics.
Identifiers: *Accelerating flow, *Multiphase flow.

The time-dependent motion of small gas bubbles in a decelerating liquid was studied. Expressions for the distance traveled by the bubble and for the bubble slip were derived as functions of liquid gas bubble densities, initial velocities, and in terms of a parameter denoting the ratio of the pressure and viscous interaction forces. In cases where the initial velocity of the bubble is lower than the liquid velocity less the limiting slip, the bubble accelerates relative to the liquid. In cases where the bubble initial velocity is equal to or greater than that of the liquid, the bubble decelerates much faster than the liquid until a limiting slip between the gas bubble and liquid is reached. At the equilbrium conditions, in all cases the gas bubble velocity is found to be smaller than that of the corresponding liquid velocity. (Knapp-USGS)

FLOW AROUND INCLINED SHEET PILE,
Indian Inst. of Science, Bangalore. Dept. of Civil and Hydraulic Engineering.
A. Siva Reddy, Govinda C. Mishra, and Kyatsandra Seetharamiah.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY7, Paper 8248, p 1101-1115, July 1971. 15 p, 7 fig, 5 ref, append.

Descriptors: *Flow around objects, *Groundwater movement, *Sheet piling, *Seepage, *Steady flow, Numerical analysis, Mathematical models, Flow nets, Permeability, Porous media, Antisotropy.
Identifiers: Inclined sheet piling.

For analysis of flow around a vertical sheet pile in homogeneous anisotropic soil, it is necessary to investigate the flow characteristics associated with an inclined sheet pile embedded in homogeneous isotropic porous media. As such, the quanitities of seepage, pressure distribution and exit gradient from an inclined sheet pile embedded in a homogeneous isotropic porous medium of finite depth are determined using the Schwarz-Christoffel transformation. Numerical results are presented for different angles of inclination of sheet piles with and without impervious blankets. (Knapp-USGS)

HYDRAULICS AND HYDRAULIC ENGINEERING (Russian: Gidravlika i Gidrotekhnika).

No 10, Kiev, 1970. 112 p.

Descriptors: *Turbulent flow, *Hydraulic properties, *Hydraulic structures, *Fluid mechanics, Hydraulic gates, Hydraulic conduits, Erosion, Reservoirs, Dams, Cavitation, Open channels, Discharge measurement, Drainage, Design data, Hydraulics, Hydrographs, Unsteady flow.
Identifiers: Quaternary clays, Pressure distribution.

This collection of 18 papers includes articles concerned with study of turbulence, cavitation, unsteady and turbulent flow in open channels, movement of fluid with variable discharge and measurement of discharges in pipe lines. A study is made of the problems of erosion in channels composed of cohesive soils and of the reforming of reservoir banks. Methods for draining Quaternary clays, output of recharge basins, operation of water-purification filters and computations of the stability of faces of earth dams are examined. (Josefson-USGS)

ROCK DRILLABILITY RELATED TO A ROLLER CONE BIT,
Dresser Industries, Inc., Hibbing, Minn.
R. I. Morris.
Society of Petroleum Engineers of A.I.M.E. paper number SPE-2389, 1969. 7 p., 4 ref., 1 tab., 7 fig.

Descriptors: *Drilling, *Drilling equipment, Rock mechanics.
Identifiers: *Rock drillability, Roller cone bit, Mining industry, Bit penetration, Drillability index.

The basic bit penetration mechanism of a roller-cone rotary bit in the development of a drillability index for 'hard' rock mining bits is explored. A 1/8 inch radius, hemispherical drill bit element is pressed into a flat surface of a hand sample with a hydraulic pump and ram until a distinct crater is formed. The crater depth divided by the ram load constitutes a penetration or drillability index, p'/E. From this index, bit type, drilling weight, average penetration rate and approximate bit life may be determined. Field results have been well within the degree of accuracy consistent with sampling error. (Campbell-NWWA)

ROTARY DRILLING: CASING AND CEMENTING.

Issued by Petroleum Extension Service, University of Texas, Austin. Lessons in Rotary Drilling, Unit II, Lesson 4: Casing and Cementing, 1968, 81 p., 58 fig.

Descriptors: Drilling, *Rotary drilling, *Casing, *Cements, Drilling equipment, Oil industry, Drilling fluids.
Identifiers: A.P.I standards, Running casing, Conductor pipe, Surface casing, Casing minimum performance properties.

Drilling for oil or gas involves two main objectives: (1) to bore a hole to the mineral accumulation, and (2) to install a pipe from the reservoir to the surface. The pipe is called 'casing,' and it is usually cemented to insure a pressure - tight connection to the reservoir. Casing in a well has six important functions: (1) to prevent caving of the hole, (2) to prevent contamination of fresh water in upper sands by fluids from lower zones, (3) to exclude water from the producing formation, (4) to confine production to the well bore, (5) to provide a means of controlling well pressure, (6) to permit installation of artificial lift equipment for producing the well. With the cable-tool method numerous strings of casing were set as a well was drilled. But one principal advantage of the rotary method is the fact that much more open hole can be drilled than was ever possible with cable tools. In rotary drilling today open hole can ordinarily be drilled as far as desired because of the better quality muds available. Casing is generally set to serve a specific purpose and is neither arbitrary nor compulsory on account of any certain hole conditions. The cost of casing is often the greatest single item of expense on a well, and the casing used in a typical well may represent a very large investment. Selection of casing sizes, weights, grades, and types of threaded connections for a given situation constitutes an engineering and economic problem of considerable importance. Assuring good material, running in the well, and cementing in place should be planned procedures. (Campbell-NWWA)

A.P.I. SPECIFICATION FOR CASING, TUBING, AND DRILL PIPE.
American Petroleum Inst., Dallas, Tex. Div. of Production.

A.P.I. Standard 5A, 31st Ed, April 1971, 70 p.

Descriptors: *Casing, *Well casing, *Drilling, Construction materials, Water conveyance, Wells, Oil industry, Pipe.
Identifiers: Pipe manufacture process, Chemical properties, Physical properties, Hydrostatic tests, Dimensions, Pipe ends, Coupling, Thread protectors, Inspection.

The purpose of this specification is to provide standards for casings, liners, tubing, work tubing and drill pipe suitable for use in drilling and producing operations. This specification covers casing, tubing, work tubing, drill pipe and casing liners in the sizes and wall thicknesses applicable to the various grades of pipe as shown in the standard lists and in the dimensional tables. It also includes casing and tubing couplings and thread protectors. Dimensional requirements on threads and thread gages, stipulations on gaging practice, gage specificatio and certification, as well as instruments a methods for inspection of threads are given in A Std 5B and are applicable to products covered this specification. (Campbell-NWWA)
W71-09711

A.P.I. SPECIFICATION FOR GRADE C-75 AN C-95 CASING AND TUBING.
American Petroleum Inst., Dallas, Tex. Div. Production.

API Standard 5 AC, 7th Ed, April 1970, 52 p.

Descriptors: *Casing, *Well casing, *Drillin Water conveyance, Construction materials, Wel Oil industry, Pipe.
Identifiers: Pipe manufacture process, Chemic properties, Physical properties, Hydrostatic tes Dimensions, Pipe ends, Coupling inspection.

The purpose of this specification is to provide sta dards for casing and tubing with restricted yie strength ranges for use in drilling and producti operations. This specification covers Grade C- casing and tubing and C-95 casing in the sizes a wall thicknesses shown in the standard lists (Tabl 1.1 and 1.2), and the dimensional tables (Tabl 6.1 through 6.6). It also includes requirements f couplings and thread protectors. Dimension requirements on threads and thread gages, stipul tions on gaging practice, gage specifications a certification, as well as instruments and metho for inspection of threads are given in API Std 5 and are applicable to products covered by th specification. (Campbell-NWWA)
W71-09712

A.P.I. SPECIFICATION FOR HIGH STRENGTH CASING AND TUBING.
American Petroleum Inst., Dallas, Tex. Div. Production.

API Standard 5AX, 8th Ed, April 1970, 45 p.

Descriptors: *Casing, *Well casing, *Drillin Water conveyance construction materials, Wel Oil industry, Pipe.
Identifiers: *Pipe manufacture process, Chemic properties, Physical properties, Hydrostatic tes Pipe ends, Couplings, Thread protectors.

The purpose of this specification is to provide sta dards for high-strength casing and tubing suitab for use in drilling and producing operations. Th specification covers high-strength seamless ste casing and tubing. It includes casing and non-ups and external-upset tubing, in the sizes and wa thicknesses shown in the standard list, and th dimensional tables. It also includes requiremen for couplings and thread protectors. Dimension requirements on threads and thread gages, stipul tions on gaging practice, gage specifications an certification, as well as instruments and metho for inspection of threads are given in API Std 5 and are applicable to products covered by th specification. (Campbell-NWWA)
W71-09713

A.P.I. SPECIFICATION FOR OIL-WELL CE MENTS AND CEMENT ADDITIVES.
American Petroleum Inst., Dallas, Tex. Div. Production.

API Specification Standard 10A, 16th Edition April 1971, 19 p.

Descriptors: *Cements, *Cement grouting, Por land cements, Slurries, Oil industry.
Identifiers: *Cement additives, Bentonite, Barite Fly ash, Chemical requirements, Physical require ments, Well depth and cementing time, Sampling Tests, Equipment, Classes, Types, Manufacturer' trade names.

This specification covers eight classes of oil-well cement, along with bentonite, barite, and fly ash (tentative) as admixtures in oil-well cement. Two classes of cement are available in the ordinary type (0), seven in the moderate sulfate-resistant type (MSR), and six in the high sulfate-resistant type (HSR), while one has the added property of high early strength. American Petroleum Institute (API) specifications are published as an aid to procurement of standardized equipment and materials. These specifications are not intended to inhibit purchasers and producers from purchasing or producing products made to specifications other than API. (Campbell-NWWA)
W71-09714

A.P.I. SPECIFICATION FOR OIL-WELL DRILLING-FLUID MATERIALS.
American Petroleum Inst., Dallas, Tex. Div. of Production.

API Standard 13A, 5th Ed, February 1969, 12 p.

Descriptors: *Drilling fluids, *Clays, *Drilling, Rotary drilling, Drilling equipment, Emulsions, Mud, Slurries, Foaming, Oil industry.
Identifiers: *Barite, *Bentonite, *Attapulgite clay, Sampling, Inspection, API authorized suppliers.

This specification is under the jurisdiction of the API Committee on Standardization of Drilling Fluid Materials. The purpose of this specification is to provide standards for materials used in oil-well drilling fluids. This specification covers physical properties and test procedures for materials used in oil-well drilling fluids. American Petroleum Institute (API) specifications are published as an aid to procurement of standardized equipment and materials. These specifications are not intended to inhibit purchasers and producers from purchasing or producing products made to specifications other than API. (Campbell-NWWA)
W71-09715

A.P.I. BULLETIN ON PERFORMANCE PROPERTIES OF CASING, TUBING AND DRILL PIPE.
American Petroleum Inst., Dallas, Tex. Div. of Production.

API Bulletin 5C2, 17th Ed, April 1970, 65 p, 4 tab.

Descriptors: *Casing, *Well casing, *Hydraulic structures, Water conveyance, Construction materials, *Drilling, Wells, Oil industry, Pipe.
Identifiers: *Collapsed pressure, *Internal yield pressure, Pipe body yield strength, Joint strength, Compression strength.

This bulletin is not intended as a design manual. Its purpose is to provide minimum performance properties on which the design of casing, tubing, and drill pipe strings may be based. The performance properties as given herein cover the grades, sizes, and weights of casing, tubing and drill pipe as given in API Stds 5A, 5AC, and 5AX. Values for various performance properties of casing, tubing, and drill pipe conforming to API Std 5A, 5AC, and 5AX are given in Tables 1 through 4. The values shown are minimum values and do not include factors of safety. In the design of casing, tubing, or drill pipe strings, factors of safety should be used as are considered necessary for the particular application. (Campbell-NWWA)

A.P.I. BULLETIN ON NONDESTRUCTIVE TESTING TERMINOLOGY.
American Petroleum Inst., Dallas, Tex. Div. of Production.

API Bulletin 5T1, 2nd Ed, April 1971, 14 p.

Descriptors: *Fabrication, *Welding, Welded joints, Construction, Oil industry.
Identifiers: *Testing terminology, Imperfections in steel pipe, Double submerged arc welds, Electric flash-welds, Electric resistance welds.

This bulletin is under the jurisdiction of the API Committee on Standardization of Tubular Goods. The purpose of this bulletin is to provide definitions of imperfections and defects which occur in steel pipe. The word 'imperfection' as used herein refers to metallurgical and other features of steel pipe products which may or may not be injurious to the use of the product. Definition of injuriousness is outside the scope of this document. Injurious defects are defined in the respective pipe standards. It should be noted that the definitions are listed in English, French, German, Italian, Japanese, and Spanish. (Campbell-NWWA)
W71-09717

API SPECIFICATION FOR LINE PIPE.
American Petroleum Inst., Dallas, Tex. Div. of Production.

API Standard 5L, 26th Ed, April 1971, 59 p.

Descriptors: *Pipes, *Well casing, *Construction materials, Hydraulic structures, *Water conveyance, Drilling, Pipelines, Metal pipes, Wells, Oil industry.
Identifiers: *Process of pipe manufacture, Chemical properties and tests, Physical properties and tests, Hydrostatic tests.

The purpose of this specification is to provide standards for pipe suitable for use in conveying gas, water, and oil in both the oil and natural gas industries. This specification covers seamless and welded steel line pipe. It includes standard-weight and extra strong threaded pipe; and standard weight plain-end, regular-weight plain-end, special plain-end, extra-strong plain-end, and double-extra-strong plain end pipe. The sizes and wall thicknessess applicable to the various processes of manufacture under this specification are indicated in the dimensional tables herein. Dimensional requirements on threads and thread gages, stipulations on gaging practice, gage specifications and certification, as well as instruments and methods for inspection of threads are given in API Std 5B and are applicable to products covered by this specification. Grade X60 or higher pipe (API Std 5LX) shall not be substituted for pipe ordered to this specification without purchaser approval. American Petroleum Institute (API) specifications are published as an aid to procurement of standardized equipment and materials. These specifications are not intended to inhibit purchasers and producers from purchasing or producing products made to specifications other than API. (Campbell-NWWA)
W71-09718

A.P.I. SPECIFICATION FOR HIGH-TEST LINE PIPE.
American Petroleum Inst., Dallas, Tex. Div. of Production.

API Standard 5LX, 18 Ed, April 1971, 60 p.

Descriptors: *Pipes, *Well casings, *Construction materials, Hydraulic structures, Pipelines, Water conveyance, Drilling, Well regulations, Metal pipes, Wells, Oil industry.
Identifiers: *Process of pipe manufacture, Chemical properties and tests, Physical properties and tests, Hydrostatic tests, Dimensions, Nondestructive inspection.

The purpose of this specification is to provide standards for more rigorously tested line pipe having greater tensile and bursting strengths than for pipe manufactured under API Std. 5L. Metric conversions of English units are provided throughout the text of this specification in parentheses. This specification covers high-test line pipe in grades X42, X46, X52, X60, X65, and grades intermediate thereto. The chemical composition and certain physical properties of intermediate grades are subject to agreement between the purchaser and manufacturer. The agreed upon requirements must be consistent with the corresponding requirements for grades X42, X46, X52, X56, X60 and X65. Grade X60 or higher pipe shall not be substituted for pipe ordered for grade X52 and lower without purchaser approval. American Petroleum Institute (API) specifications are published as an aid to procurement of standardized equipment and materials. These specifications are not intended to inhibit purchasers and producers from purchasing or producing products made to specifications other than API. (Campbell-NWWA)
W71-09719

THE EFFECTS OF DRILLING-MUD ADDITIVES ON OIL-WELL CEMENTS.
American Petroleum Institute, Dallas, Tex. Div. of Production.

API Bulletin D-4, March 1963, 39 p, 28 tab, 1 fig, 21 ref. (A report prepared by the API Mid-Continent District Study Committee on Cementing Practices and Testing of Oil-Well Cements.

Descriptors: *Cements, *Cement grouting, Portland cement, Slurries, Oil industry.
Identifiers: *Cement additives, Cement strength, Thickening time, Retarders, Accelerators, Sodium hydroxide, Sodium carbonate, Sodium silicate, Dosium hexametaphosphate, Sodium acid pyrophosphate, Sodium chloride, Starch, Sodium carboxymethylcellulose, Salts of liqninsulfonic acid-kembreak, Tanninquebracho, Sodium palconate, Tall-oil soap, Carbonox.

The information contained in this report summarizes the data obtained from a series of cooperative tests conducted by the API Mid-Continent District Study Committee on Cementing Practices and Testing of Oil-well Cements to determine the effect of a number of drilling-mud treating chemicals on the thickening time and strength of three types (API Class A, D, and E) of commercial cements commonly used in oil-well cementing operations. This study revealed that many of the additives, notably the organic materials in relatively small quantities, had a marked effect on the properties of the cements tested. The results of this study emphasize the fact that precautionary measures should be taken to prevent contamination of the cement with drilling mud when cementing oil wells. (Campbell-NWWA)
W71-09720

A BASIC STUDY OF FERROUS MATERIALS FOR DESALINATION EQUIPMENT,
Case Western Reserve Univ., Cleveland, Ohio.
A. R. Troiano, and R. F. Heheman.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402, Price $0.65. Office of Saline Water Research and Development Progress Report No 637, December 1970, 59 p, 19 fig, 3 tab, 43 ref, append. OSW Contract 14-01-0001-1443.

Descriptors: *Desalination, *Iron alloys, *Corrosion, *Pitting, Corrosion control.
Identifiers: Instantaneous corrosion rate, Tafel slope, Weight loss tests, *Electrochemical methods, Linear polarization, Surface enrichment.

Of primary interest was an examination and an evaluation, both theoretical and practical, of accelerated corrosion rate measurements by electrochemical methods to provide information much quicker than conventional weight loss tests. These instantaneous corrosion rate determinations also provide a means for continuous monitoring and control of the corrosive environment. There are, essentially two such methods, Tafel, and that of Linear Polarization. Material used throughout most of this work was 'Glidden' iron with impurity contents of C .005, P .003, S .004, Si .005, Cr .001, Co .001, Mn .002, Ni .001 and an alloy of iron - 9% Chromium. Studies were made of the effects of temperature, pH, time, and the influence of

Chromium alloying and dissolved oxygen. Weight loss studies comprised the second part of this research. Alloys consisted of commercially available ferrous alloys containing major alloying elements of Si, Cr, and Mo and the counterparts of these alloys prepared from high purity elements. Methods and procedures of preparation and testing are presented along with results. A third part of this program explored the concept of surface enrichment of a base metal (iron) with a noble metal. Iron-platinum, iron-iridium, iron-gold alloys were examined. (Filban-Office of Saline Water)
W71-09746

MASTER THE TOOLS THAT COMBAT CORROSION,
Corrosion Mitigation Inc., Marietta, Ga.
H. C. Van Nouhuys.
Pipeline Engineer, Vol. 34, No. 3, p 286, 288, 292 and 294, March 1962.

Descriptors: *Corrosion, *Well casing, *Water well, Groundwater, Water quality.
Identifiers: Galvanic anodes, Rectifiers, Ground bed systems, Pipe coatings.

The corrosion engineer has five basic tools with which to combat corrosion: galvanic anodes, rectifier-ground bed units, coatings, bonds, and insulators. How and where the corrosion engineer uses each method, or combination of methods, can spell the difference between an effective or an ineffective job of corrosion mitigation. Some examples are (1) a bare pipeline in high resistivity soil requires rectifiers instead of galvanic anodes; (2) galvanic anodes, strategically placed in a pump station piping network, give protection that rectifier currents cannot provide; (3) where a coated, protected foreigh line crosses under a bare, protected line, a bond is not the answer, but coating the bare line several hundred feet in each direction restores normal potentials to the coated line without bond; (4) a good bond is highly essential, however, at the terminal dock; and (5) the combined use of rectifiers and anodes is not recommended. This papers also has applicability to water well installations. (Campbell-NWWA)

ENVIRONMENTAL RADIOACTIVITY, ISPRA 1969,
W71-09862 05B

ENVIRONMENTAL EFFECTS
SURVEY OF ENVIRONMENTAL RADIOACTIVITY FOR PERIOD JANUARY 1, 1969 TO JUNE 30, 1969,
W71-09496 05B

ENVIRONMENTAL STATEMENT ON THE PROPOSED ELECTRIC POWER ENVIRONMENTAL POLICY ACT.
W71-09589 06E

TEMPERATURE TOLERANCE OF YOUNG-OF-THE-YEAR CISCO, COREGONUS ARTEDI,
W71-09659 05C

ESTABLISHING THE ENVIRONMENTAL QUALITY COUNCIL AND THE CITIZENS ADVISORY COMMITTEE ON ENVIRONMENTAL QUALITY,
W71-09663 06E

SEXUAL DIFFERENCE IN HEAT RESISTANCE OF THE OZARK MINNOW, DIONDA NUBILA (FORBES),
W71-09673 05C

II. SUBLETHAL EFFECTS AND CHANGES IN ECOSYSTEMS
ASSESSMENT OF THE EFFECTS OF POLLUTANTS ON PHYSIOLOGY AND BEHAVIOUR,
W71-09679 05C

MASS MORTALITY OF THE CREVALLE JACK, CARANX HIPPOS (LINNAEUS) ON THE ATLANTIC COAST OF MASSACHUSETTS,
W71-09680 05C

DEEP OCEAN DUMPING OF BALED REFUSE.
W71-09704 06E

ENVIRONMENTAL DEFENSE FUND INC V CORPS OF ENGINEERS (INJUNCTION HALTING CONSTRUCTION OF BARGE CANAL).
W71-09708 06E

MERCURY IN THE ENVIRONMENT,
W71-09776 05B

ESCAROSA A PRELIMINARY STUDY OF COASTAL ZONE MANAGEMENT PROBLEMS AND OPPORTUNITIES IN ESCAMBIA AND SANTA ROSA COUNTIES, FLORIDA.
W71-09794 02L

ENVIRONMENTAL PROBLEMS
THE FUNCTION OF SOCIAL BEHAVIOR IN WATER RESOURCE DEVELOPMENT.
W71-09470 06B

ENVIRONMENTAL QUALITY
COMPREHENSIVE WATER RESOURCES MANAGEMENT--THE PAST AND THE FUTURE,
W71-09472 06B

ECONOMICS OF POLLUTION CONTROL,
W71-09761 05G

AN APPROACH TO THE PROBLEM OF ESTIMATING DEMAND FOR PUBLIC GOODS,
W71-09887 06D

BACKGROUND FOR THE ECONOMIC ANALYSIS OF ENVIRONMENTAL POLLUTION,
W71-09889 05G

THE USE OF STANDARDS AND PRICES FOR PROTECTION OF THE ENVIRONMENT,
W71-09900 05G

ENVIRONMENTAL CONTROL AND ECONOMIC SYSTEMS,
W71-09902 05G

ENVIRONMENTAL SANITATION
RESUME OF SEWERAGE AND REFUSE DISPOSAL PRACTICES OF SANITATION DISTRICTS OF LOS ANGELES COUNTY,
W71-09585 05E

A BILL TO CONSENT TO THE INTERSTATE ENVIRONMENT COMPACT.
W71-09702 06E

ENVIRONMENTAL VISION
AGRICULTURAL BENEFITS FROM URBAN POLLUTION CONTROL,
W71-09764 05D

ENZYME REPRESSION
AEROBIC HETEROTROPHIC BACTERIAL POPULATIONS OF SEWAGE AND ACTIVATED SLUDGE, IV. ADAPTATION OF ACTIVATED SLUDGE TO UTILIZATION OF AROMATIC COMPOUNDS,
W71-09532 05D

ENZYMES
AEROBIC HETEROTROPHIC BACTERIAL POPULATIONS OF SEWAGE AND ACTIVATED SLUDGE, IV. ADAPTATION OF ACTIVATED SLUDGE TO UTILIZATION OF AROMATIC COMPOUNDS,
W71-09532 05D

THE ISOLATION AND CHARACTERIZATION OF SORBITOL-6-PHOSPHATE DEHYDROGENASE FROM CLOSTRIDIUM PASTEURIANUM,
W71-09547 05D

EPHEMERAL STREAMS
MECHANICAL SAMPLER FOR DETERMINING THE WATER QUALITY OF EPHEMERAL STREAMS,
W71-09613 05A

EQUIPMENT
TWO-STAGE METHOD OF PUMPING BY NEGATIVE PRESSURE,
W71-09612 08C

MECHANICAL SAMPLER FOR DETERMINING THE WATER QUALITY OF EPHEMERAL STREAMS,
W71-09613 05A

A GAMMA ATTENUATION UNIT AND LOGISTIC SYSTEM FOR MONITORING WATER CONTENT OF LARGE SOIL COLUMNS,
W71-09614 07B

EROSION
TRANSVERSE EROSIONAL MARKS OF MUD AND ROCK THEIR PHYSICAL BASIS AND GEOLOGICAL SIGNIFICANCE,
W71-09624 02J

EROSION CONTROL
CONSEQUENCES OF HISTORIC RAINFALL ON WESTERN IOWA FARMLAND,
W71-09609 02J

ESCAMBIA COUNTY
ESCAROSA A PRELIMINARY STUDY OF COASTAL ZONE MANAGEMENT PROBLEMS AND OPPORTUNITIES IN ESCAMBIA AND SANTA ROSA COUNTIES, FLORIDA.
W71-09794 02L

ESTIMATED NEEDS
URBAN LOCAL OUTDOOR RECREATION FACILITIES,
W71-09892 06B

ESTIMATION
AN APPROACH TO THE PROBLEM OF ESTIMATING DEMAND FOR PUBLIC GOODS,
W71-09887 06D

ESTUARIES
A WATER RESOURCE-WATER SUPPLY STUDY OF THE POTOMAC ESTUARY,
W71-09788 05B

UTILITY OF RADIOISOTOPE METHODOLOGY IN ESTUARY POLLUTION CONTROL STUDIES. PART I. EVALUATION OF THE USE OF RADIOISOTOPES AND FLUORESCENT DYES FOR DETERMINING LONGITUDINAL DISPERSION COEFFICIENT IN ESTUARIES.
W71-09791 05B

ESCAROSA A PRELIMINARY STUDY OF COASTAL ZONE MANAGEMENT PROBLEMS AND OPPORTUNITIES IN ESCAMBIA AND SANTA ROSA COUNTIES, FLORIDA.
W71-09794 02L

STUDIES OF ESTUARINE DEPENDENCE OF ATLANTIC COASTAL FISHES,
W71-09800 05C

ALTERNATIVE OXYGENATION POSSIBLITIES FOR LARGE POLLUTED RIVERS,
W71-09821 05G

SOME PROBLEMS OF MOVEMENT OF SOLID MATERIALS AND OF EROSION IN ESTUARIES AND DELTAS (FRENCH QUELQUES PROBLEMES DU MOUVEMENT DES MATERIAUX SOLIDES ET DE L'EROSION DANS LES ESTUAIRES ET LES DELTAS),
W71-09839 02J

ESTUARINE ENVIRONMENT
BAY-DELTA WATER QUALITY SUBCOMMITTEE PRELIMINARY REPORT.
W71-09578 06G

STATEMENT OF THE BOARD OF SUPERVISORS OF CONTRA COSTA COUNTY REGARDING THE REPORT OF THE U.S. BUREAU OF RECLAMATION ON THE FEASIBILITY OF THE 'PERIPHERAL CANAL UNIT CENTRAL VALLEY PROJECT, CALIFORNIA'.
W71-09580 06G

STATEMENT OF THE BOARD OF SUPERVISORS OF CONTRA COSTA COUNTY, REGARDING EFFECT OF REDUCED OUTFLOW UPON THE SAN FRANCISCO BAY-SACRAMENTO-SAN JOAQUIN DELTA ESTUARINE SYSTEM.
W71-09584 06G

ESTUARINE FISH
MASS MORTALITY OF THE CREVALLE JACK, CARANX HIPPOS (LINNAEUS) ON THE ATLANTIC COAST OF MASSACHUSETTS,
W71-09680 05C

ETHANOL
EFFECT OF ETHANOL, BOURBON AND VARIOUS ETHANOL LEVELS ON Y-MAZE LEARNING IN THE GOLDFISH,
W71-09669 05C

EUROPEAN USSR
JUSTIFICATION CHECK OF A METHOD FOR CALCULATING RESERVOIR-BANK TRANSFORMATION, AS WORKED OUT AT THE STATE HYDROLOGICAL INSTITUTE, AGAINST FIELD-OBSERVATION DATA (RUSSIAN PROVERKA OPRAVDYVAYEMOSTI METODA RASCHETA PEREFORMIROVANIYA BEREGOV VODOKHRANILISHCH, RAZRABOTANNOGO V GGI, PO MATERIALAM NATURNYKH NABLYUDENIY),
W71-09648 02J

EUTROPHICATION
PHYTOPLANKTON DYNAMICS AND PRODUCTIVITY IN A SHALLOW, HIGHLY EUTROPHIC LAKE WITH SPECIAL REFERENCE TO MELOSIRA AMBIGUA (GRUN.) O. MULL. AND M. GRANULATA (EHR.) RALFS,
W71-09561 05C

REDUCED FLOWS AND THE FUTURE ECOLOGY OF THE BAY-DELTA SYSTEM,
W71-09582 06G

ON THE SIGNIFICANCE OF METAL COMPLEXING AGENTS IN SECONDARY SEWAGE EFFLUENTS,
W71-09674 05B

EVALUATION
THE ECONOMICS OF REGIONAL POLLUTION CONTROL SYSTEMS,
W71-09544 05D

A CASE STUDY OF WATER RESOURCES DEVELOPMENT - AN ANALYSIS OF A PROPOSED PROJECT ON THE MISSOURI RIVER,
W71-09740 06B

CAPITAL ALLOCATION THEORY THE STUDY OF INVESTMENT DECISIONS,
W71-09875 06C

SYSTEMS ANALYSIS AND PROJECT MANAGEMENT,
W71-09879 06B

EVAPORATION
FERMENTATION WASTE DISPOSAL IN GREAT BRITAIN,
W71-09543 05D

A THREE-DIMENSIONAL APPROACH TO THE EXCHANGE OF HEAT AND WATER VAPOR BETWEEN A LARGE WATER BODY AND THE ATMOSPHERE,
W71-09739 02D

A STUDY OF WINTERTIME HEAT LOSSES FROM A WATER SURFACE AND OF HEAT CONSERVATION AND HEAT ADDITION TO COMBAT ICE

FORMATION IN THE ST. LAWRENCE RIVER,
W71-09773 02D

THE SINUSODIAL FUNCTION OF REGIONAL MONTHLY AVERAGE RELATIVE PAN EVAPORATION,
W71-09814 02D

EVAPORATIVE CAPACITY OF UNSATURATED AIR,
W71-09818 02D

EVAPORATIVE CAPACITY(AIR)
EVAPORATIVE CAPACITY OF UNSATURATED AIR,
W71-09818 02D

EVAPOTRANSPIRATION
EVAPOTRANSPIRATION AND ITS CHEMICAL REDUCTION,
W71-09556 02D

EVAPOTRANSPIRATION AND ENERGY BALANCES OF FOREST AND FIELD,
W71-09608 02D

EXCLUDABILITY
PRIVATE COSTS OF USING PUBLIC GOODS,
W71-09893 06C

EXCRETION
EFFECT OF M.S. 222 ON NITROGEN EXCRETION OF THE BLUEGILL (LEPOMIS MACROCHIRUS),
W71-09675 05C

EXFILTRATION
CONTROL OF INFILTRATION AND INFLOW INTO SEWER SYSTEMS.
W71-09591 08A

EXPANSIVE CLAYS
THE FORMATION OF STABLE SOLS FROM LAPONITE, A SYNTHETIC HECTORITE-LIKE CLAY,
W71-09639 02G

EXPLOSIONS
RADIOACTIVITY IN WATER PROJECT MILROW,
W71-09515 05B

EXPLOSIVE DRILLING
DEEP-HOLE DRILLING WITH EXPLOSIVES,
W71-09914 08A

EXPLOSIVES
RADIOACTIVITY IN WATER PROJECT MILROW,
W71-09515 05B

EXTERNALITIES
THE USE OF STANDARDS AND PRICES FOR PROTECTION OF THE ENVIRONMENT,
W71-09900 05G

FABRICATION
A.P.I. BULLETIN ON NONDESTRUCTIVE TESTING TERMINOLOGY.
W71-09717 08G

FALLOUT
RADIOACTIVE FALLOUT IN AIR AND RAIN--RESULTS TO THE MIDDLE OF 1969,
W71-09492 05A

COLUMBIA RIVER STUDIES 1969-1970, UPTAKE OF FE-55 BY MUSSELS FROM THE WASHINGTON COAST, 1962-1969,
W71-09505 05C

ENVIRONMENTAL RADIOACTIVITY - ISPRA (ITALY),
W71-09516 05B

PARTICULATE PB, PB 210 AND PO 210 IN THE ENVIRONMENT,
W71-09799 05A

UNSOLVED PROBLEMS OF AQUATIC RADIOECOLOGY,
W71-09847 05B

FARM WASTES
IMPLICATIONS OF CROP-PRODUCTION TECHNOLOGY FOR ENVIRONMENTAL QUALITY,
W71-09476 05B

REPORT TO THE CONTRA COSTA COUNTY WATER AGENCY ON A STUDY OF THE EFFECTS OF THE PROPOSED FEDERAL SAN LUIS INTERCEPTOR DRAIN AND THE STATE SAN JOAQUIN VALLEY MASTER DRAIN.
W71-09577 06G

A DOSING SIPHON FOR DISCHARGING CLEANING WATER INTO FLUSHING GUTTERS,
W71-09747 05G

GROWING CORN IN GROWTH CHAMBERS WITH DIFFERENT MANURE TREATMENTS,
W71-09748 03F

ROLE OF EXCRETED CHLORTETRACYCLINE IN MODIFYING THE DECOMPOSITION PROCESS IN FEEDLOT WASTE,
W71-09749 05C

RAPID CONCENTRATION OF STRONGYLE EGGS FROM EQUINE FECES FOR IN VITRO STUDIES,
W71-09750 05A

ALTERNATIVES FOR THE TREATMENT AND DISPOSAL OF ANIMAL WASTES,
W71-09751 05D

POLLUTION, PESTICIDES AND THE PEOPLE --- AGRICULTURE AND OUR NATURAL ENVIRONMENT.
W71-09752 05C

LIVESTOCK WASTE,
W71-09759 05D

FAULTS(GEOLOGY)
REMARKS ON THE REGIONAL GEOLOGICAL STRUCTURE OF THE NILE DELTA,
W71-09832 02J

FEATHER RIVER PROJECT
METHODS FOR PROTECTING AREAS OF WATER ORIGIN,
W71-09685 06B

FEDERAL FINANCE
PLANNING FOR WESTERN REGIONAL WATER DEVELOPMENT,
W71-09697 06B

FEDERAL PROJECT POLICY
ESTABLISHING THE ENVIRONMENTAL QUALITY COUNCIL AND THE CITIZENS ADVISORY COMMITTEE ON ENVIRONMENTAL QUALITY,
W71-09663 06E

FERMENTATION
FERMENTATION WASTE DISPOSAL IN GREAT BRITAIN,
W71-09543 05D

FERROUS SULFATE
PRECIPITATION OF PHOSPHATES FROM WATER WITH FERROUS SALTS,
W71-09555 05D

FILTRATION
WATER FILTRATION OPTIMIZATION BY GEOMETRIC PROGRAMMING,
W71-09528 05D

FINANCING
URBAN LOCAL OUTDOOR RECREATION FACILITIES,
W71-09892 06B

FINITE DIFFERENCE METHOD
IMPROVEMENTS IN THE FINITE DIFFERENCE SOLUTION OF TWO-DIMENSIONAL DISPERSION PROBLEMS,
W71-09611 05B

USE OF THE FINITE-ELEMENT METHOD IN THE SOLUTION OF DIFFUSION-CONVECTION EQUATIONS,
W71-09804 02F

FISH
MERCURY IN THE ADRIATIC,
W71-09796 05C

FISH ANESTHETICS
EFFECT OF M.S. 222 ON NITROGEN EXCRETION OF THE BLUEGILL (LEPOMIS MACROCHIRUS),
W71-09675 05C

FISH BEHAVIOR
FALL CHINOOK SALMONS SPAWNING IN THE COLUMBIA RIVER NEAR HANFORD, 1947-1969,
W71-09573 05C

TEMPERATURE, TIMING, AND SEAWARD MIGRATION OF JUVENILE CHINOOK SALMON FROM THE CENTRAL COLUMBIA RIVER,
W71-09574 05C

EFFECT OF ETHANOL, BOURBON AND VARIOUS ETHANOL LEVELS ON Y-MAZE LEARNING IN THE GOLDFISH,
W71-09669 05C

STATE-DEPENDENT OR 'DISSOCIATED' LEARNING WITH ALCOHOL IN THE GOLDFISH,
W71-09670 05C

WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH. REPORT ON EXTREME PH VALUES AND INLAND FISHERIES,
W71-09683 05C

FISH EGGS
EFFECTS OF CHRONIC EXPOSURE OF CHINOOK SALMON EGGS AND ALEVINS TO GAMMA IRRADIATION,
W71-09853 05C

FISH HATCHERIES
SURVEY OF TREATMENT AND RECYCLE OF USED FISH HATCHERY WATER,
W71-09530 05D

FISH PARASITES
IMPOUNDMENT EFFECTS ON WATER QUALITY AS REFLECTED IN PARASITISM OF RESERVOIR BASSES,
W71-09559 05C

FISH PHYSIOLOGY
INORGANIC COMPOSITION OF GALLBLADDER BILE FROM FASTED RAINBOW TROUT,
W71-09666 05C

OXIDATIVE METABOLISM OF ROTENONE IN MAMMALS, FISH, AND INSECTS AND ITS RELATION TO SELECTIVE TOXICITY,
W71-09668 05C

EFFECT OF ETHANOL, BOURBON AND VARIOUS ETHANOL LEVELS ON Y-MAZE LEARNING IN THE GOLDFISH,
W71-09669 05C

STATE-DEPENDENT OR 'DISSOCIATED' LEARNING WITH ALCOHOL IN THE GOLDFISH,
W71-09670 05C

TOXICITY OF PCP FOR THE 'DOJO' FISH, MISGURNUS ANGUILLICAUDATUS (CANTOR), WITH SPECIAL REFERENCE TO THE ESTIMATION OF SIZE FACTOR (IN JAPANESE),

W71-09672 05C

SEXUAL DIFFERENCE IN HEAT RESISTANCE OF THE OZARK MINNOW, DIONDA NUBILA (FORBES),
W71-09673 05C

EFFECT OF M.S. 222 ON NITROGEN EXCRETION OF THE BLUEGILL (LEPOMIS MACROCHIRUS),
W71-09675 05C

TOXICITY AND TREATMENT OF DE-INKING WASTES CONTAINING DETERGENTS,
W71-09678 05C

II. SUBLETHAL EFFECTS AND CHANGES IN ECOSYSTEMS ASSESSMENT OF THE EFFECTS OF POLLUTANTS ON PHYSIOLOGY AND BEHAVIOUR,
W71-09679 05C

MASS MORTALITY OF THE CREVALLE JACK, CARANX HIPPOS (LINNAEUS) ON THE ATLANTIC COAST OF MASSACHUSETTS,
W71-09680 05C

FISHERIES
INDUSTRIAL WASTES FROM SEAFOOD PLANTS IN THE STATE OF ALASKA,
W71-09551 05D

COMPREHENSIVE WATERSHED MANAGEMENT-THE ANADROMOUS FISHERY RESOURCE,
W71-09583 06G

A COMPREHENSIVE STUDY OF SAN FRANCISCO BAY,
W71-09790 05A

FISHES
STUDIES OF ESTUARINE DEPENDENCE OF ATLANTIC COASTAL FISHES,
W71-09800 05C

FISHING
SOME FACTORS ASSOCIATED WITH THE CEDLINE OF THE LAKE ERIE COMMERCIAL FISHING INDUSTRY IN OHIO,
W71-09897 06B

FISHING(DRILLING)
ROTARY DRILLING FISHING.
W71-09931 08A

FISHKILL
THE 1967 SHARK KILL IN SAN FRANCISCO BAY,
W71-09677 05C

MASS MORTALITY OF THE CREVALLE JACK, CARANX HIPPOS (LINNAEUS) ON THE ATLANTIC COAST OF MASSACHUSETTS,
W71-09680 05C

THERMAL POLLUTION FISHKILL.
W71-09781 05C

FLOCCULATION
THE DIFFERENTIAL THERMAL ANALYSIS OF FLOCCULATED CLAY SAMPLES,
W71-09641 02J

FLOOD CONTROL
THE OAKLEY PROJECT--A CONTROVERSY IN LAND USE,
W71-09474 06G

FORECASTING THE SPRING 1969 MIDWEST SNOWMELT FLOODS,
W71-09571 02A

FLOOD DAMAGE
FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

FLOOD PLAIN INFORMATION, LENOIR, NORTH CAROLINA, LOWER CREEK, BLAIR FORK, LONG BRANCH, ZACKS FORK CREEK AND ZACKS FORK BRANCH.
W71-09600 04A

FLOOD PLAIN INFORMATION, TINKERS CREEK, TWINSBURG, SUMMIT COUNTY, OHIO.
W71-09601 04A

FLOOD PLAIN INFORMATION, MORGANTON, NORTH CAROLINA - VOLUME 2. CATAWBA RIVER, SILVER CREEK AND BAILEY FORK.
W71-09845 04A

FLOOD PLAIN INFORMATION, ALBUQUERQUE ARROYOS, PART 1, ALBUQUERQUE, NEW MEXICO.
W71-09846 04A

FLOOD DAMAGE ABATEMENT
FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

FLOOD FORECASTING
FORECASTING THE SPRING 1969 MIDWEST SNOWMELT FLOODS,
W71-09571 02A

FLOOD WAVE MODIFICATION ALONG A PRISMATIC RIVER,
W71-09819 02E

FLOOD PLAIN MANAGEMENT
THE OAKLEY PROJECT--A CONTROVERSY IN LAND USE,
W71-09474 06G

FLOOD PLAIN ZONING
FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

FLOOD PLAINS
FLOOD PLAIN INFORMATION, TINKERS CREEK, TWINSBURG, SUMMIT COUNTY, OHIO.
W71-09601 04A

FLOOD PLAIN INFORMATION, ALBUQUERQUE ARROYOS, PART 1, ALBUQUERQUE, NEW MEXICO.
W71-09846 04A

FLOOD ROUTING
FLOOD WAVE MODIFICATION ALONG A PRISMATIC RIVER,
W71-09819 02E

FLOODS
FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

FLOOD PLAIN INFORMATION, LENOIR, NORTH CAROLINA, LOWER CREEK, BLAIR FORK, LONG BRANCH, ZACKS FORK CREEK AND ZACKS FORK BRANCH.
W71-09600 04A

FLOOD PLAIN INFORMATION, TINKERS CREEK, TWINSBURG, SUMMIT COUNTY, OHIO.
W71-09601 04A

AN INVESTIGATION OF FLOODS IN HAWAII THROUGH SEPTEMBER 30, 1970,
W71-09627 02E

FLOOD WAVE MODIFICATION ALONG A PRISMATIC RIVER,
W71-09819 02E

FLOOD PLAIN INFORMATION, MORGANTON, NORTH CAROLINA - VOLUME 2. CATAWBA RIVER, SILVER CREEK AND BAILEY FORK.
W71-09845 04A

FLOOD PLAIN INFORMATION, ALBUQUERQUE ARROYOS, PART 1, ALBUQUERQUE, NEW MEXICO.
W71-09846 04A

FLORIDA
ENVIRONMENTAL DEFENSE FUND INC V CORPS OF ENGINEERS (INJUNCTION HALTING CONSTRUCTION OF BARGE CANAL).
W71-09708 06E

ESCAROSA A PRELIMINARY STUDY OF COASTAL ZONE MANAGEMENT PROBLEMS AND OPPORTUNITIES IN ESCAMBIA AND SANTA ROSA COUNTIES, FLORIDA.
W71-09794 02L

FLOW
TRANSIENT SEEPAGE FLOW TOWARD TWO PARALLEL DRAINS,
W71-09560 04A

HYDROLOGIC RECONNAISSANCE OF THE DELTA RIVER AND ITS DRAINAGE BASIN, ALASKA.
W71-09566 02A

WILLOW SPRINGS AND SAG JUNCTION DIVERSIONS, CHICAGO SANITARY AND SHIP CANAL, ILLINOIS, HYDRAULIC MODEL INVESTIGATION.
W71-09567 08B

TURTLE CREEK, PENNSYLVANIA, CHANNEL IMPROVEMENT. HYDRAULIC MODEL INVESTIGATION,
W71-09568 08B

ARKANSAS RIVER NAVIGATION ENTRANCE. HYDRAULIC MODEL INVESTIGATION,
W71-09569 08B

MOVEMENT OF SMALL GAS BUBBLES IN SMOOTHLY DECELERATING LIQUID,
W71-09811 08B

FLOW AROUND OBJECTS
FLOW AROUND INCLINED SHEET PILE,
W71-09812 08B

FLOW RATES
SANITARY SEWAGE TRANSPORT VELOCITY,
W71-09588 08B

FLUID MECHANICS
HYDRAULICS AND HYDRAULIC ENGINEERING (RUSSIAN GIDRAVLIKA I GIDROTEKHNIKA).
W71-09844 08B

FLUID MOTION EQUATIONS
TWO LAYER STRATIFIED FLOW IN CONVERGING SECTION,
W71-09777 08B

FLUORESCENCE
SHORT-TERM FLUORESCENCE AND DISSOLVED OXYGEN RELATIONSHIPS IN THE UPPER CHESAPEAKE BAY,
W71-09681 05A

UTILITY OF RADIOISOTOPE METHODOLOGY IN ESTUARY POLLUTION CONTROL STUDIES. PART I. EVALUATION OF THE USE OF RADIOISOTOPES AND FLUORESCENT DYES FOR DETERMINING LONGITUDINAL DISPERSION COEFFICIENT IN ESTUARIES.
W71-09791 05B

FLUORESCENT DYES
FLUORESCENT DYES, THEIR UPTAKE AND TANSLOCATION IN PLANTS,
W71-09815 02I

FLUSHING GUTTER
A DOSING SIPHON FOR DISCHARGING CLEANING WATER INTO FLUSHING GUTTERS,
W71-09747 05G

FOAM FRACTIONATION
THE APPLICATION OF BACTERIAL PROCESS KINETICS IN STREAM SIMULATION AND STREAM ANALYSIS,
W71-09553 05G

FOOD CHAINS
MERCURY IN THE ENVIRONMENT,
W71-09776 05B

MERCURY IN THE ADRIATIC,
W71-09796 05C

NATURAL AND ARTIFICIAL RADIONUCLIDES IN SEAFOODS AND MARINE PROTEIN CONCENTRATES,
W71-09849 05A

TURNOVER AND CONCENTRATION OF RADIONUCLIDES IN FOOD CHAINS,
W71-09851 05C

HAZARDS OF INTERNAL CONTAMINATION OF A HUMAN POPULATION FROM THE RADIOACTIVE POLLUTION OF WATERS, (IN FRENCH),
W71-09858 05C

RESEARCH ON THE MARINE FOOD CHAIN, PROGRESS REPORT, JULY 1969-JUNE 1970, PART III,
W71-09859 05C

FOOD PROCESSING
AEROBIC SECONDARY TREATMENT OF POTATO PROCESSING WASTES.
W71-09526 05D

FOOD WASTES
TREATMENT OF WASTES FROM FOOD MANUFACTURE AND COFFEE PROCESSING,
W71-09545 05D

FORECASTING
JUSTIFICATION CHECK OF A METHOD FOR CALCULATING RESERVOIR-BANK TRANSFORMATION, AS WORKED OUT AT THE STATE HYDROLOGICAL INSTITUTE, AGAINST FIELD-OBSERVATION DATA (RUSSIAN PROVERKA OPRAVDYVAYEMOSTI METODA RASCHETA PEREFORMIROVANIYA BEREGOV VODOKHRANILISHCH, RAZRABOTANNOGO V GGI, PO MATERIALAM NATURNYKH NABLYUDENIY),
W71-09648 02J

FORESTS
EVAPOTRANSPIRATION AND ENERGY BALANCES OF FOREST AND FIELD,
W71-09608 02D

FOSSIL FUELS
FOSSIL FUELS AS A SOURCE OF MERCURY POLLUTION,
W71-09770 05B

FOULING
THE ROLE OF PRIMARY PRODUCTION IN SOLVING PROBLEMS OF HYDROBIOLOGICAL PROCESSES AND THE MEANS OF CONTROLLING THEM,
W71-09575 05C

FOURIER ANALYSIS
THE SINUSOIDAL FUNCTION OF REGIONAL MONTHLY AVERAGE RELATIVE PAN EVAPORATION,
W71-09814 02D

USE OF HARMONIC ANALYSIS TO STUDY TIDAL FLUCTUATIONS IN AQUIFERS NEAR THE SEA,
W71-09824 02F

FRACTURE ACIDIZING
WHY STRONG ACID PAYS OFF IN CARBONATE RESERVOIRS,
W71-09916 08A

FREE SURFACES
TRANSIENT SEEPAGE FLOW TOWARD TWO PARALLEL DRAINS,
W71-09560 04A

FRESHWATER FISH
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH. REPORT ON EXTREME PH VALUES AND INLAND FISHERIES,
W71-09683 05C

FROUDE NUMBER
TWO LAYER STRATIFIED FLOW IN CONVERGING SECTION,
W71-09777 05B

FUNGI
THE OCCURRENCE OF FUNGI IN ACID-MINE DRAINAGE,
W71-09541 05G

CARNIVOROUS PLANTS IN ACTIVATED SLUDGE,

W71-09588 08B

CONTROL OF INFILTRATION AND INFLOW INTO SEWER SYSTEMS.
W71-09591 08A

SHADOW MOUNTAIN RECREATION AREA
GROUNDWATER RECONNAISSANCE STUDY OF SELECTED SITES IN ROCKY MOUNTAIN NATIONAL PARK AND SHADOW MOUNTAIN NATIONAL RECREATION AREA,
W71-09597 04B

SHARKS
THE 1967 SHARK KILL IN SAN FRANCISCO BAY,
W71-09677 05C

SHEET EROSION
CONSEQUENCES OF HISTORIC RAINFALL ON WESTERN IOWA FARMLAND,
W71-09609 02J

SHEET PILING
FLOW AROUND INCLINED SHEET PILE,
W71-09812 08B

SHIPS
NAVIGABLE WATERS POLLUTION CONTROL ACT OF 1965 (A BILL TO PROVIDE FOR THE ESTABLISHMENT OF REGULATIONS FOR THE PURPOSE OF CONTROLLING POLLUTION FROM VESSELS AND OTHER SOURCES IN THE NAVIGABLE WATERS OF THE UNITED STATES).
W71-09766 06E

SINKING AGENTS
EVALUATING OIL SPILL CLEANUP AGENTS. DEVELOPMENT OF TESTING PROCEDURES AND CRITERIA,
W71-09789 05G

SLOPES
THE SLOPE OF ABYSSAL PLAINS,
W71-09604 02J

SLUDGE
ACCELERATED DIGESTION OF CONCENTRATED SLUDGE,
W71-09537 05D

SLUDGE BULKING
THE EFFECT OF NITROGEN AND PHOSPHOROUS COMPOUNDS ON ONE OF THE MICROORGANISMS RESPONSIBLE FOR SLUDGE BULKING,
W71-09550 05D

SLUDGE TREATMENT
THE EFFECT OF NITROGEN AND PHOSPHOROUS COMPOUNDS ON ONE OF THE MICROORGANISMS RESPONSIBLE FOR SLUDGE BULKING,
W71-09550 05D

SNOW MELT
FORECASTING THE SPRING 1969 MIDWEST SNOWMELT FLOODS,
W71-09571 02A

SNOW PHYSICAL PROPERTIES
PHYSICAL PROPERTIES OF ALPINE SNOW AS RELATED TO WEATHER AND AVALANCHE CONDITIONS,
W71-09596 02C

SNOW REMOVAL
RUNOFF OF DEICING SALT EFFECT ON IRONDEQUOIT BAY, ROCHESTER, NEW YORK,
W71-09803 05B

SNOW SURVEYS
WATER CONDITIONS IN CALIFORNIA.
W71-09586 02C

SNOWPACKS
WATER CONDITIONS IN CALIFORNIA.
W71-09586 02C

PHYSICAL PROPERTIES OF ALPINE SNOW AS RELATED TO WEATHER AND AVALANCHE CONDITIONS,
W71-09596 02C

SOCIAL BEHAVIOR
THE FUNCTION OF SOCIAL BEHAVIOR IN WATER RESOURCE DEVELOPMENT.
W71-09470 06B

SOCIAL RESPECTS
THE OAKLEY PROJECT--A CONTROVERSY IN LAND USE,
W71-09474 06G

SOCIAL VALUES
THE FUNCTION OF SOCIAL BEHAVIOR IN WATER RESOURCE DEVELOPMENT.
W71-09470 06B

SOCIALISM
ENVIRONMENTAL CONTROL AND ECONOMIC SYSTEMS,
W71-09902 05G

SOCIOECONOMIC CHARACTERISTICS
WHAT DO WE MEAN BY POLLUTION,
W71-09753 05A

SOIL CHEMISTRY
ISOTOPICALLY EXCHANGEABLE COBALT THE EFFECT OF SOIL PH AND IONIC SATURATION OF THE SOIL,
W71-09617 02K

INTRODUCTION TO SYMPOSIUM--THE SOIL SOLUTION,
W71-09619 02G

IONIC CONCENTRATIONS AND ACTIVITIES IN THE SOIL SOLUTIONS,
W71-09620 02G

SOLUTION OF ION ACTIVITY AND PLANT GROWTH,
W71-09621 02G

COMPUTATION OF SOIL SOLUTION COMPOSITION VARIATION WITH WATER CONTENT FOR DESATURATED SOILS,
W71-09622 02G

PROBLEMS ASSOCIATED WITH THE DETERMINATION AND APPLICATION OF THE SOLUBILITY PRODUCT CONSTANT,
W71-09623 02G

MINERALIZATION OF ORGANIC PHOSPHORUS IN OLIGOTROPHIC LAKE SEDIMENTS,
W71-09738 05C

EFFECT OF ADDED SALT ON NITROGEN MINERALIZATION IN THREE CALIFORNIA SOILS,
W71-09809 02G

SOIL CONSERVATION
GREAT LAKES BASIN CONSERVATION ACT (A BILL TO AMEND THE SOIL CONSERVATION AND DOMESTIC ALLOTMENT ACT TO PROVIDE FOR A GREAT LAKES BASIN CONSERVATION PROGRAM).
W71-09703 06E

CURRENT CONSERVANCY LEGISLATION,
W71-09762 05G

SOIL CONTAMINATION
SURVEY OF ENVIRONMENTAL RADIOACTIVITY,
W71-09499 05B

SOIL CORES
A GAMMA ATTENUATION UNIT AND LOGISTIC SYSTEM FOR MONITORING WATER CONTENT OF LARGE SOIL COLUMNS,
W71-09614 07B

SOIL EROSION
CONSEQUENCES OF HISTORIC RAINFALL ON WESTERN IOWA FARMLAND,
W71-09609 02J

SOIL PIPING AND STREAM CHANNEL INITIATION,
W71-09827 02J

SOIL FORMATION
A STUDY OF WEATHERING IN A SOIL DERIVED FROM A BIOTITE-HORNBLENDE ROCK, I. WEATHERING OF BIOTITE,
W71-09635 02G

SOIL MOISTURE METERS
A GAMMA ATTENUATION UNIT AND LOGISTIC SYSTEM FOR MONITORING WATER CONTENT OF LARGE SOIL COLUMNS,
W71-09614 07B

SOIL PIPING
SOIL PIPING AND STREAM CHANNEL INITIATION,
W71-09827 02J

SOIL SOLUTION
INTRODUCTION TO SYMPOSIUM--THE SOIL SOLUTION,
W71-09619 02G

SOIL SOLUTIONS
IONIC CONCENTRATIONS AND ACTIVITIES IN THE SOIL SOLUTIONS,
W71-09620 02G

SOIL STRUCTURE
FURROW INFILTRATION RATES AS AFFECTED BY INCORPORATION OF STRAW OR FURROW CULTIVATION,
W71-09808 02G

SOIL WATER
INTRODUCTION TO SYMPOSIUM--THE SOIL SOLUTION,
W71-09619 02G

IONIC CONCENTRATIONS AND ACTIVITIES IN THE SOIL SOLUTIONS,
W71-09620 02G

COMPUTATION OF SOIL SOLUTION COMPOSITION VARIATION WITH WATER CONTENT FOR DESATURATED SOILS,
W71-09622 02G

PROBLEMS ASSOCIATED WITH THE DETERMINATION AND APPLICATION OF THE SOLUBILITY PRODUCT CONSTANT,
W71-09623 02G

EFFECT OF ADDED SALT ON NITROGEN MINERALIZATION IN THREE CALIFORNIA SOILS,
W71-09809 02G

THE ROLE OF SPARINGLY SOLUBLE SOLIDS AND CATION EXCHANGE REACTIONS IN CONTROLLING CONDITIONS IN SOIL SOLUTIONS,
W71-09810 02G

SOIL WATER MOVEMENT
A STATISTICAL METHOD FOR ANALYSIS OF DIFFUSION IN SOILS,
W71-09615 02G

LIMITATIONS ON SCALING BY CONTACT ANGLE,
W71-09806 02G

SOIL PIPING AND STREAM CHANNEL INITIATION,
W71-09827 02J

SOILS
BIOGEOCHEMICAL DISPERSION HALOS OF TIN IN A MONSOON CLIMATE OF THE SOUTHERN PART OF THE SOVIET FAR EAST (RUSSIAN BIOGEOKHIMICHESKIYE OREOLY RASSEYANIYA OLOVA V USLOVIYAKH MUSSONNOGO KLIMATA YUGA DAL'NEGO VOSTOKA),
W71-09645 05B

SOIL-WATER-PLANT RELATIONSHIPS
SOLUTION OF ION ACTIVITY AND PLANT GROWTH,
W71-09621 02G

BIOGEOCHEMICAL DISPERSION HALOS OF TIN IN A MONSOON CLIMATE OF THE SOUTHERN PART OF THE SOVIET FAR EAST (RUSSIAN BIOGEOKHIMICHESKIYE OREOLY RASSEYANIYA OLOVA V USLOVIYAKH MUSSONNOGO KLIMATA YUGA DAL'NEGO VOSTOKA),
W71-09645 05B

FLUORESCENT DYES, THEIR UPTAKE AND TANSLOCATION IN PLANTS,
W71-09815 02I

SOLAR RADIATION
A STUDY OF WINTERTIME HEAT LOSSES FROM A WATER SURFACE AND OF HEAT CONSERVATION AND HEAT ADDITION TO COMBAT ICE FORMATION IN THE ST. LAWRENCE RIVER,
W71-09773 02D

SOLS
THE FORMATION OF STABLE SOLS FROM LAPONITE, A SYNTHETIC HECTORITE-LIKE CLAY,
W71-09639 02G

SOLUBILITY
A LABORATORY STUDY OF THE SOLUBLE METALS IN ROCK FROM THE BROAD QUADRANGLE, GEORGIA,
W71-09466 02K

THE SOLUBILITY OF CO2 IN WATER AND SEA WATER,
W71-09605 02K

EFFECT OF MG(2+) ION ON THE SOLUBILITY OF SOLID CARBONATES,
W71-09616 02K

PROBLEMS ASSOCIATED WITH THE DETERMINATION AND APPLICATION OF THE SOLUBILITY PRODUCT CONSTANT,
W71-09623 02G

THE ROLE OF SPARINGLY SOLUBLE SOLIDS AND CATION EXCHANGE REACTIONS IN CONTROLLING CONDITIONS IN SOIL SOLUTIONS,
W71-09810 02G

SOLUBILITY PRODUCT
PROBLEMS ASSOCIATED WITH THE DETERMINATION AND APPLICATION OF THE SOLUBILITY PRODUCT CONSTANT,
W71-09623 02G

THE ROLE OF SPARINGLY SOLUBLE SOLIDS AND CATION EXCHANGE REACTIONS IN CONTROLLING CONDITIONS IN SOIL SOLUTIONS,
W71-09810 02G

SOLUBLE METALS
A LABORATORY STUDY OF THE SOLUBLE METALS IN ROCK FROM THE BROAD QUADRANGLE, GEORGIA,
W71-09466 02K

SOMALI CURRENT
MONSOONAL RESPONSE IN THE WESTERN INDIAN OCEAN,
W71-09603 02B

SPRINGFIELD
CAN COST BE CUT,
W71-09488 06C

STABILIZATION
ROLE OF EXCRETED CHLORTETRACYCLINE IN MODIFYING THE DECOMPOSITION PROCESS IN FEEDLOT WASTE,
W71-09749 05C

STANDARDS
STATE CERTIFICATION OF ACTIVITIES REQUIRING A FEDERAL LICENSE OR PERMIT.
W71-09705 06E

ELECTRIC POWER GENERATION AND THE ENVIRONMENT,
W71-09768 05C

STARVED FISH
INORGANIC COMPOSITION OF GALLBLADDER BILE FROM FASTED RAINBOW TROUT,
W71-09666 05C

STATE GROUNDWATER AGENCIES
THE VALUE OF STATE GROUNDWATER AGENCIES TO THE SMALL WATER WELL CONTRACTOR,
W71-09728 06E

STATISTICAL METHODS
A STATISTICAL METHOD FOR ANALYSIS OF DIFFUSION IN SOILS,
W71-09615 02G

TOXICITY OF PCP FOR THE 'DOJO' FISH, MISGURNUS ANGUILLICAUDATUS (CANTOR), WITH SPECIAL REFERENCE TO THE ESTIMATION OF SIZE FACTOR (IN JAPANESE),
W71-09672 05C

A FAST FRACTIONAL GAUSSIAN NOISE GENERATOR,
W71-09823 07C

STATISTICAL MODELS
A FAST FRACTIONAL GAUSSIAN NOISE GENERATOR,
W71-09823 07C

STATISTICS
STATISTICAL LIMITS OF ACCURACY AND PRECISION OF GROSS ALPHA AND BETA RADIOACTIVITY MEASUREMENTS IN WATER,
W71-09626 05A

VARIABILITY OF ANNUAL RUNOFF IN THE LAKE ONTARIO BASIN,
W71-09825 02E

STEADY FLOW
FLOW AROUND INCLINED SHEET PILE,
W71-09812 08B

STIMULATION
WHY STRONG ACID PAYS OFF IN CARBONATE RESERVOIRS,
W71-09916 08A

STIMULATION (WELLS)
SUCCESSFUL ACIDIZING,
W71-09909 08A

STINGRAYS
THE 1967 SHARK KILL IN SAN FRANCISCO BAY,
W71-09677 05C

STOCHASTIC PROCESSES
A FAST FRACTIONAL GAUSSIAN NOISE GENERATOR,
W71-09823 07C

STORM RUNOFF
RETENTION BASIN CONTROL OF COMBINED SEWER OVERFLOWS.
W71-09592 05G

YEAGER V CITY OF PITTSBURGH (NEGLIGENCE IN MAINTAINING OPEN SEWER).
W71-09828 06E

STRATIFIED FLOW
TWO LAYER STRATIFIED FLOW IN CONVERGING SECTION,
W71-09777 05B

STRATIGRAPHY
GEOPHYSICAL CONTRIBUTIONS TO THE STUDY OF THE GEOLOGIC EVOLUTION AND MORPHOGENESIS OF THE DANUBE DELTA (FRENCH CONTRIBUTIONS GEOPHYSIQUES A LA CONNAISSANCE DE L'EVOLUTION GEOLOGIQUE ET DE LA MORPHOGENESE DU DELTA DU DANUBE),
W71-09841 02J

STREAM ANALYSIS
LABORATORY AND MATHEMATICAL SIMULATION OF OXYGEN BALANCES EFFECTED IN STREAMS,
W71-09554 05G

STREAM FAUNA
PRELIMINARY REPORT ON THE BENTHIC FAUNA OF THE RIVER TESHIO (IN JAPANESE),
W71-09676 05B

STREAMBEDS
PRELIMINARY REPORT ON THE BENTHIC FAUNA OF THE RIVER TESHIO (IN JAPANESE),
W71-09676 05B

STREAMFLOW
CHARACTERISTICS OF THE WATER FLOW INSIDE THE DANUBE DELTA,
W71-09830 02J

STREETER-PHELPS EQUATION
LABORATORY AND MATHEMATICAL SIMULATION OF OXYGEN BALANCES EFFECTED IN STREAMS,
W71-09554 05G

STRIP MINE WASTES
THE EFFECT OF IRRIGATION WITH MUNICIPAL SEWAGE EFFLUENT AND SLUDGE ON SELECTED TREES, GRASSES, AND LEGUMES PLANTED IN BITUMINOUS STRIP-MINE SOIL,
W71-09529 05D

STRIPPING
CN IMPROVING WASTE WATER QUALITY,
W71-09535 05D

STRONGYLE EGGS
RAPID CONCENTRATION OF STRONGYLE EGGS FROM EQUINE FECES FOR IN VITRO STUDIES,
W71-09750 05A

STRONTIUM RADIOISOTOPES
ROLE OF FRESHWATER PLANTS IN THE COPRECIPITATION OF STRONTIUM-90 WITH CALCIUM CARBONATES (IN RUSSIAN),
W71-09501 05C

RADIOACTIVITY CONTENTS IN SOME PLANKTON AND SEA WATER SAMPLES COLLECTED DURING THE PERIOD BETWEEN 1960 AND 1968,
W71-09857 05C

STRUCTURAL GEOLOGY
REMARKS ON THE REGIONAL GEOLOGICAL STRUCTURE OF THE NILE DELTA,
W71-09832 02J

STRUCTURES
PERMITS FOR WORK IN NAVIGABLE WATERS.
W71-09495 06E

SUBSIDENCE
DELTAS OF THE ZONES CHARACTERIZED BY SINKING OF THE EARTH'S CRUST,
W71-09842 02J

SUBSIDIES
THE USE OF STANDARDS AND PRICES FOR PROTECTION OF THE ENVIRONMENT,
W71-09900 05G

SUPPLEMENTALS
A NOTE ON SUPPLEMENTAL APPROPRIATIONS IN THE FEDERAL BUDGETARY PROCESS,
W71-09895 06C

SURFACE RUNOFF
RETENTION BASIN CONTROL OF COMBINED SEWER OVERFLOWS.
W71-09592 05G

SURFACE WATERS
PRELIMINARY REPORT ON THE WATER RESOURCES OF SOUTHEAST MAUI, HAWAII,
W71-09598 02E

DISTRIBUTION AND FORMS OF MERCURY IN GROUND-AND SURFACE WATERS IN A REGION OF MOLYBDENUM DEPOSITS (RUSSIAN O RASPROSTRANENNOSTI I FORMAKH NAKHOZHDENIYA RTUTI V GRUNTOVYKH I POVERKHNOSTNYKH VODAKH V RAYONE MOLIBDENOVYKH MESTOROZHDENIY),
W71-09644 05B

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR PIN OAK CREEK, TRINITY RIVER BASIN, TEXAS, 1969,
W71-09653 07C

SURFACE-GROUNDWATER RELATIONSHIPS
USE OF HARMONIC ANALYSIS TO STUDY TIDAL FLUCTUATIONS IN AQUIFERS NEAR THE SEA,
W71-09824 02F

SOIL PIPING AND STREAM CHANNEL INITIATION,
W71-09827 02J

SURFACTANTS
EVALUATING OIL SPILL CLEANUP AGENTS. DEVELOPMENT OF TESTING PROCEDURES AND CRITERIA,

UPPER GREAT LAKES REGIONAL COMMISSION
NEW LIFE FOR 'MINI-LAKE ERIES',
W71-09693 05F

URBANIZATION
NATIONAL CONFERENCE ON URBAN WATER RESEARCH, KEYNOTE AND PLENARY SESSION PAPERS.
W71-09468 06B

A NATIONAL URBAN WATER RESOURCES RESEARCH PROGRAM.
W71-09469 06B

FLOOD PLAIN INFORMATION, ALBUQUERQUE ARROYOS, PART 1, ALBUQUERQUE, NEW MEXICO.
W71-09846 04A

USER CHARGES
URBAN LOCAL OUTDOOR RECREATION FACILITIES,
W71-09892 06B

USSR
FORMATION OF FRESH GROUNDWATERS IN THE KONKA-YALY DEPRESSION (RUSSIAN O FORMIROVANII PRESNYKH PODZEMNYKH VOD KONKSKO-YALYNSKOY VPADINY),
W71-09642 02F

PREDICTING EARTHQUAKES BY HYDROGEOLOGICAL METHODS (RUSSIAN K PROGNOZIROVANIYU ZEMLETRYASENIY GIDROGEOLOGICHESKIM METODAMI),
W71-09643 07B

DISTRIBUTION AND FORMS OF MERCURY IN GROUND-AND SURFACE WATERS IN A REGION OF MOLYBDENUM DEPOSITS (RUSSIAN O RASPROSTRANENNOSTI I FORMAKH NAKHOZHDENIYA RTUTI V GRUNTOVYKH I POVERKHNOSTNYKH VODAKH V RAYONE MOLIBDENOVYKH MESTOROZHDENIY),
W71-09644 05B

BIOGEOCHEMICAL DISPERSION HALOS OF TIN IN A MONSOON CLIMATE OF THE SOUTHERN PART OF THE SOVIET FAR EAST (RUSSIAN BIOGEOKHIMICHESKIYE OREOLY RASSEYANIYA OLOVA V USLOVIYAKH MUSSONNOGO KLIMATA YUGA DAL'NEGO VOSTOKA),
W71-09645 05B

AN OUTLINE OF THE DEVELOPMENT OF HYDROLOGY IN THE USSR (RUSSIAN OCHERKI RAZVITIYA GIDROLOGII V SSSR),
W71-09646 02A

RADIATION REGIME OF LAKES AND RESERVOIRS (RUSSIAN RADIATSIONNYY REZHIM OZER I VODOKHRANILISHCH),
W71-09647 02H

JUSTIFICATION CHECK OF A METHOD FOR CALCULATING RESERVOIR-BANK TRANSFORMATION, AS WORKED OUT AT THE STATE HYDROLOGICAL INSTITUTE, AGAINST FIELD-OBSERVATION DATA (RUSSIAN PROVERKA OPRAVDYVAYEMOSTI METODA RASCHETA PEREFORMIROVANIYA BEREGOV VODOKHRANILISHCH, RAZRABOTANNOGO V GGI, PO MATERIALAM NATURNYKH NABLYUDENIY),
W71-09648 02J

DELTAS OF THE ZONES CHARACTERIZED BY SINKING OF THE EARTH'S CRUST,
W71-09842 02J

UTILITIES
A UTILITY COMPANY'S FIRST STEP INTO THE WORLD OF COMPUTERS,
W71-09695 03D

VACUUM PUMPS
TWO-STAGE METHOD OF PUMPING BY NEGATIVE PRESSURE,
W71-09612 08C

VARIABILITY
VARIABILITY OF ANNUAL RUNOFF IN THE LAKE ONTARIO BASIN,
W71-09825 02E

VEGETATION ESTABLISHMENT
THE EFFECT OF IRRIGATION WITH MUNICIPAL SEWAGE EFFLUENT AND SLUDGE ON SELECTED TREES, GRASSES, AND LEGUMES PLANTED IN BITUMINOUS STRIP-MINE SOIL,
W71-09529 05D

VERNON PARISH(LA)
WATER RESOURCES OF THE SLAGLE-SIMPSON-FLATWOODS AREA, LOUISIANA,
W71-09657 02F

VIABILITY
AEROBIC HETEROTROPHIC BACTERIAL POPULATIONS OF SEWAGE AND ACTIVATED SLUDGE, IV. ADAPTATION OF ACTIVATED SLUDGE TO UTILIZATION OF AROMATIC COMPOUNDS,
W71-09532 05D

VIRGINIA
FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

VIRICIDES
NEW WATER DISINFECTANT AN INSOLUBLE QUATERNARY AMMONIUM RESIN-TRIIODIDE COMBINATION THAT RELEASES BACTERICIDE ON DEMAND,
W71-09562 05F

VOLCANIC ASH
EXTRACTION OF ANIONS AND CATIONS FROM RECENT VOLCANIC ASH,
W71-09807 02G

VOLCANOES
EXTRACTION OF ANIONS AND CATIONS FROM RECENT VOLCANIC ASH,
W71-09807 02G

WAGER QUALITY CONTROL
LABORATORY AND MATHEMATICAL SIMULATION OF OXYGEN BALANCES EFFECTED IN STREAMS,
W71-09559 05G

WASHINGTON
POWERS OF CITIES WATER MANAGEMENT AND POLLUTION CONTROL.
W71-09520 06E

WASTE ASSIMILATIVE CAPACITY
LABORATORY AND MATHEMATICAL SIMULATION OF OXYGEN BALANCES EFFECTED IN STREAMS,
W71-09554 05G

CONVOLUTION APPROACH TO THE SOLUTION FOR THE DISSOLVED OXYGEN BALANCE EQUATION IN A STREAM,
W71-09820 05B

WASTE DISPOSAL
REMOVAL OF RADIOISOTOPES FROM LIQUID WASTES BY SORPTION IN LOCAL MINERALS,
W71-09517 05D

DEEP OCEAN DUMPING OF BALED REFUSE.
W71-09704 06E

A COMPREHENSIVE STUDY OF SAN FRANCISCO BAY,
W71-09790 05A

A CONSTANT GEOMETRY APPROACH TO IN SITU SEABED GAMMA MONITORING,
W71-09798 05A

WASTE LOAD
A SUMMARY OF WATER POLLUTION PROBLEMS IN THE LAKE MICHIGAN BASIN,
W71-09883 05B

WASTE TREATMENT
TOXICITY AND TREATMENT OF DE-INKING WASTES CONTAINING DETERGENTS,
W71-09678 05C

WASTE WATER
FEASIBILITY STUDY FOR GLENDALE - LOS ANGELES WATER RECLAMATION PLANT.

FLOOD DAMAGE ABATEMENT STUDY FOR VIRGINA,
W71-09467 06F

VOLCANI INST. OF AGRICULTURAL RESEARCH, BET DAGAN (ISRAEL) AND CALIFORNIA UNIV., BERKELEY. DEPT. OF CIVIL ENGINEERING.
ANALYSIS OF NONSTEADY FLOW WITH A FREE SURFACE USING THE FINITE ELEMENT METHOD,
W71-09826 02F

VYZKUMNY USTAV RYBARSKY A HYDROBILOGICKY VODNANY, PRAGUE (CZECHOSLOVAKIA).
TOXICITY OF PESTICIDES WITH A HIGH CONTENT OF 4,6-DINITRO-O-CRESOL FOR FISH (IN CZECH),
W71-09671 05C

WASHINGTON STATE DEPT. OF ECOLOGY, OLYMPIA.
MERCURY IN WASHINGTON STATE,
W71-09792 05B

WASHINGTON UNIV., SEATTLE. COLL. OF FISHERIES.
EFFECTS OF CHRONIC EXPOSURE OF CHINOOK SALMON EGGS AND ALEVINS TO GAMMA IRRADIATION,
W71-09853 05C

WASHINGTON UNIV., SEATTLE. LAB. OF RADIATION ECOLOGY.
COLUMBIA RIVER STUDIES, ANNUAL PROGRESS REPORT, 1969-1970,
W71-09504 05C

COLUMBIA RIVER STUDIES 1969-1970, UPTAKE OF FE-55 BY MUSSELS FROM THE WASHINGTON COAST, 1962-1969,
W71-09505 05C

COLUMBIA RIVER STUDIES 1969-1970, ZINC BIOLOGICAL HALF-LIFE FOR OYSTERS IN A NATURAL ENVIRONMENT,
W71-09506 05C

COLUMBIA RIVER STUDIES 1969-1970, MONITORING OF MUSSELS FROM WASHINGTON WATERS FOR ZINC-65,
W71-09507 05C

COLUMBIA RIVER STUDIES 1969-1970, EFFECTS OF TEMPERATURE AND IONIZING RADIATION ON THE LARVAE OF THE PACIFIC OYSTER,
W71-09508 05C

COLUMBIA RIVER STUDIES 1969-1970, EFFECTS OF SHOCK TEMPERATURE AND IONIZING RADIATION ON PHYTOPLANKTON,
W71-09509 05C

WASHINGTON UNIV., SEATTLE. SCHOOL OF MEDICINE.
MERCURY IN MAN,
W71-09778 05C

WATER ECONOMICS RESEARCH INST., WARSAW (POLAND).
TWO LAYER STRATIFIED FLOW IN CONVERGING SECTION,
W71-09777 05B

WATER RESOURCES ENGINEERS, INC., SPRINGFIELD, VA.
CONVERGENCE CRITERIA FOR ITERATIVE HYDROLOGIC ROUTING MODELS,
W71-09610 02A

WEIZMANN INST. OF SCIENCE, REHVOTH (ISRAEL). ISOTOPE DEPT.
INTERSTITIAL DIFFUSION AND ADVECTION OF SOLUTE IN ACCUMULATING SEDIMENTS.,
W71-09606 02J

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA. ENVIRONMENTAL SYSTEMS DEPT.
ELECTRIC POWER GENERATION AND THE ENVIRONMENT,
W71-09768 05C

WINDSOR UNIV. (ONTARIO). DEPT. OF GEOGRAPHY.
VARIABILITY OF ANNUAL RUNOFF IN THE LAKE ONTARIO BASIN,
W71-09825 02E

WISCONSIN DEPT. OF NATURAL RESOURCES, MADISON.
WISCONSIN WATER RESOURCE PROBLEMS,
W71-09485 06C

NEW LIFE FOR 'MINI-LAKE ERIES',
W71-09693 05F

WISCONSIN DEPT. OF NATURAL RESOURCES, MADISON. BUREAU OF WATER AND SHORELAND MANAGEMENT.
SHORELAND ZONING COMES TO WISCONSIN,
W71-09486 06E

WISCONSIN DEPT. OF NATURAL RESOURCES, MADISON. BUREAU OF RESEARCH.
EXPLORING LAKE MICHIGAN WETLANDS,
W71-09487 06D

WISCONSIN STATE UNIV., SUPERIOR.
CASING DETECTOR AND SELF-POTENTIAL LOGGER,
W71-09724 08A

WISCONSIN UNIV., MADISON. DEPT. OF MECHANICS AND WISCONSIN UNIV., MADISON. DEPT. OF PHYSICS AND WISCONSIN UNIV., MADISON. WATER RESOURCES CENTER.
TRANSIENT SEEPAGE FLOW TOWARD TWO PARALLEL DRAINS,
W71-09560 04A

WISCONSIN UNIV., MADISON. WATER RESOURCES CENTER.
PHYTOPLANKTON DYNAMICS AND PRODUCTIVITY IN A SHALLOW, HIGHLY EUTROPHIC LAKE WITH SPECIAL REFERENCE TO MELOSIRA AMBIGUA (GRUN.) O. MULL. AND M. GRANULATA (EHR.) RALFS,
W71-09561 05C

WYOMING STATE ENGINEER'S OFFICE, CHEYENNE.
WYOMING WATER AND THE MINERAL INDUSTRY, THE LAW, THE PROBLEMS, AND SOURCES OF INFORMATION,
W71-09727 06E

WYOMING UNIV., LARAMIE.
WATER RESOURCE OBSERVATORY WIND DATA - WATER YEAR 1969 AND PRIOR,
W71-09745 07C

XAVIER UNIV., CINCINNATI, OHIO.
DECISION MAKING THROUGH OPERATIONS RESEARCH,
W71-09871 06B

ZAKAVKAZSKII NAUCHO-ISSLEDOVATELSKII GIDROMETEOROLOGICHESKII INSTITUT, TIFLIS (USSR).
HYDRAULIC THEORY FOR THE BOTTOM STREAM MOVEMENT OF THE RIVER BED SEDIMENT ON THE LANDWARD SIDE OF THE SHELF EDGE IN ESTUARIES,
W71-09837 02J

A. Center of Competence		
National Water Well Association - Water Well Construction Technology	W71-09710 -- 09734 09904 -- 09931	53
AEC Oak Ridge National Laboratory - Nuclear Radiation and Safety	W71-09489 -- 09494 09496 -- 09519 09522 -- 09523 09847 -- 09864	50
U.S. Geological Survey - Hydrology	W71-09593 -- 09657 09802 -- 09827 09829 -- 09846 09467	110
Rutgers-the State University - Water Resources Economics	W71-09477 -- 09488 09684 -- 09687 09690 -- 09691 09693 -- 09697 09865 -- 09868 09870 -- 09881 09883 -- 09884 09886 -- 09887 09889 -- 09890 09892 -- 09895 09897 -- 09900 09902 -- 09903	55
University of Texas - Wastewater Treatment and Management	W71-09524 -- 09551 09553	29
University of Washington - Water Quality Requirements for Aquatic Organisms	W71-09658 -- 09659 09661 -- 09662 09664 -- 09683	24
Vanderbilt University - Thermal Pollution	W71-09765, 09767 -- 09784 09787	20
Iowa State University - Agricultural Livestock Wastes	W71-09747 -- 09764	18
Oceanic Research Institute - Coastal Pollution	W71-09788 -- 09801	13
University of Chicago - Metropolitan Water Resources Management	W71-09469 -- 09476	8
University of Florida - Eastern US Water Law	W71-09698 -- 09709 09495, 09552 09564, 09589 09660, 09663 09688, 09689 09692, 09744 09766, 09785 09786, 09828 09869, 09882 09898, 09520	29

ABSTRACT SOURCES

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association Research Foundation.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

INDEXES

- SUBJECT INDEX
- AUTHOR INDEX
- ORGANIZATIONAL INDEX
- ACCESSION NUMBER INDEX
